etching (ech'ing), *n.* [Verbal n. of *etch*[1], *v.*] 1. A process of engraving in which the lines are produced by the action of an acid or mordant instead of by a burin. A plate (usually of copper, but sometimes of glass, stone, etc., according to the use to which it is to be put, or the effect sought to be produced) is covered with a ground made of asphaltum, wax, and pitch, which is evenly blackened with the smoke of wax tapers. (See *etching-ground.*) On this ground the design is drawn with a steel point or needle, as with a pencil on paper (care being taken not to cut the metal), the point leaving the metal exposed where it passes. The plate is then submerged in a bath of dilute acid, which bites in those parts of the surface exposed by the drawn lines, while the remainder of the surface is protected from its action by the wax coating. Furrows are thus formed which, when the plate has been cleaned and charged with ink, will, if impressed upon a piece of moist paper, print an impression of the design. When blackened, the plate may be plunged into cold water to give its surface a polish. For copperplates to be used in printing, the mordant commonly used is nitric acid, but in its place some modern etchers employ a so-called "Dutch mordant," made of muriatic acid and chlorate of potash. When the fainter lines of the design appear to be sufficiently bitten in, the plate is taken from the bath and, after being carefully washed in cold water these lines are stopped out with a paint-brush charged with a varnish made of asphaltum and turpentine, so that they will be protected from the acid when the plate is replaced in it. This process is repeated from time to time until the strongest lines in the design have been sufficiently bitten in, after which the remaining ground is washed off with spirits of turpentine, and the plate is ready to be inked. Artists who etch from nature while the plate is in the acid bath proceed inversely — that is, they begin by biting in the stronger lines, and end with the fainter; but in either case, whether the latter are stopped out or last put in, they are subjected to a smaller degree of acid action. If the first impressions are imperfect, the plate can be retouched with the dry-point, or rebitten after a fresh ground has been laid on with a roller. The tools used in etching comprise needles, gravers or burins of different shapes, scrapers, burnishers, oil-rubbers, dabbers, camel's-hair brushes, etc. A surface of porcelain may be etched and bitten, and the sunken lines then filled with a metallic pigment which on refiring can be burned into the ware and covered with glaze.

Some plates were sent abroad about the year 1530, eaten with aqua fortis after Parmesano; and *etching* with corrosive waters began by some to be attempted with laudable success. *Evelyn*, Sculpture.

2. An impression taken from an etched plate.—3. A line etched, or appearing as if etched. [Rare.]

Never is my imagination so busy as in framing his responses from the *etchings* of his countenance.
Sterne, Tristram Shandy, vii. 32.

Calligraphic etching, a process consisting in drawing with a pen dipped in common ink on a well-cleaned copperplate. When the ink is dry the plate is covered with a thin etching-ground, and afterward smoked. It is then left for a quarter of an hour in a bath of cold water, which softens the ink, so that when on removal from the bath the surface is gently rubbed with a piece of flannel, the ink and the varnish over it will come away together, leaving the design clearly traced in bright lines on the copper, to be bitten in as usual.—**Etching-embroidery,** a kind of fancy-work done with black silk and with water-color, such as sepia and India ink, upon a light silk ground, in imitation of prints from engravings and etchings. It was very much in fashion during the early part of the nineteenth century.—**Etching figure.** See *figure.*—**Painter's etching,** a phrase used to designate an etching which in first conception, composition, delineation, and mechanical execution is entirely the work of one artist, as opposed to an etching executed after a design or picture by another artist.—**Soft-ground etching,** also called *gravure en manière de crayon*, an etching executed by covering a plate with a ground made of equal parts of

the ordinary etching-ground and tallow, or, in summer, of two thirds of the first and one third of the second, melted together, which, when cooled, is rolled into balls wrapped in silk. After laying the ground and smoking it lightly, a piece of thin paper with a grain is laid upon it, on which a design is drawn with a lead-pencil. As the varnish attaches itself to the paper in proportion to the pressure of the hand, when the paper is lifted the lines traced by the pencil are exposed upon the plate, and when bitten in will yield a facsimile impression of the design.

etching-ground (ech'ing-ground), *n.* The varnish or coating used in etching to protect the surface of the metal plate from the action of the mordant. An ordinary ground is made of 2 ounces of natural or Egyptian asphaltum, 1½ ounces of virgin wax, and 1 ounce of Burgundy pitch. These ingredients are melted over a slow fire, thoroughly compounded, and, while still pliant, rolled into balls for use. A transparent ground for retouching is made of 5 parts of white wax, to which, when melted, 3 parts of gum mastic in powder have been added; or of 1 ounce of resin and 2 ounces of wax, set to simmer over a fire in a glazed pipkin; or of turpentine varnish with a small quantity of oxid of bismuth.

etching-needle (ech'ing-nē″dl), *n.* A sharp instrument of steel for tracing outlines, etc., on plates to be etched. Needles for use in etching proper are sharpened perfectly round and are of several degrees of fineness; those used in etching with the dry-point are sharpened on a flat hone but not strapped, so as to produce a cutting angle on one side of the point.

etching-point (ech'ing-point), *n.* A steel or diamond point employed in etching; an etching-needle.

3. In a special metaphysical use, existing outside of all relations of time; independent of all time-conditions; not temporal.

For there were no days and nights and months and years before the heaven was created, but when he created the heaven he created them also. All these are the parts of time, and the past and future are created species of time, which we unconsciously but wrongly transfer to the *eternal* essence; for we say indeed that he was, he is, he will be, but the truth is that "he is" alone truly expresses him, and that "was" and "will be" are only to be spoken of generation in time.
Plato, Timæus (trans. by Jowett), § 38.

4. By hyperbole, having no recognized or perceived end of existence; indefinite in duration; perpetual; ceaseless; continued without intermission.

Thenceforth *eternall* union shall be made

The sound the water made,
A sweet *eternal* murmur, still the same.
Bryant, Sella.

Eternal generation, in *theol.*, the communication of the divine essence from God the Father to God the Son. The Catholic, orthodox, or Trinitarian doctrine is that God the Son, being truly God equally with God the Father, is existent from all eternity to all eternity, and that accordingly God has always existed as Father and as Son, so that the divine act of generation is itself eternal, that is, never had a beginning and can never have an end. This doctrine is opposed to the Arian teaching that "there was [a time] when he [the Son] was not," and that "before being begotten he was not." As involving paternity and filiation, the act by which the Son proceeds from the Father is distinctively called *begetting* or *generation*, while that by which the Holy Ghost proceeds from the Father (according to John xv. 26 and the terminology of the Eastern Church), or from the Father and the Son (in the language of Western theology), is called *procession* simply, or distinctively *spiration.*=**Syn.** *Eternal, Everlasting, Immortal, Perpetual;* interminable, perennial, imperishable. *Eternal* primarily means without beginning or end, but secondarily without end; *everlasting* properly means lasting from the present to an endless future. Both *eternal* and *everlasting* are peculiarly associated with the divine being or function. *Immortal* applies to that which cannot or will not die: as, "*immortal* hate." *Milton*, P. L., i. 104; "married to *immortal* verse," *Milton*, L'Allegro, l. 137. It is sometimes applied to God (1 Tim. i. 17). *Perpetual* points to the future, and applies especially to that which is established: as, a *perpetual* covenant, desolation, feud. It is freely applied to anything that lasts indefinitely. All the four words are often used by hyperbole for that which has long duration. See *incessant.*

What can it then avail, though yet we feel
Strength undiminish'd, or *eternal* being,
To undergo *eternal* punishment?

2. In *astron.* and *physics*, a hypothetical medium of extreme tenuity and elasticity supposed to be diffused throughout all space (as well as among the molecules of which solid bodies are composed), and to be the medium of the transmission of light and heat. See the extract.

The phenomena of Light are best explained as those of undulations; but undulations, even in the most extensive use of the term, as signifying any periodic motion or condition whose periodicity obeys the laws of wave motion, must be propagated through some medium. Heat, while passing through space, presents exactly the same undulatory character, and requires a medium for its propagation. Electrical attraction and repulsion are explained in far the most satisfactory way by considering them as due to local stresses in such a medium. Current electricity seems due to a throb or series of throbs in such a medium, when released from stress. Magnetic phenomena seem due to local whirlpools, set up in such a medium. . . . We are led to infer, therefore, that there is such a medium, which we call the Luminiferous *Ether*, or simply the *Ether;* that it can convey energy; that it can present it at any instant, partly in the form of kinetic, partly in that of potential energy; that it is therefore capable of displacement and of tension; and that it must have rigidity and elasticity. Calculation leads us to infer that its density is (Clerk Maxwell) 1/000000000 that of water, or equal to that of our atmosphere at a height of about 210 miles, a density vastly greater than that of the same atmosphere in the interstellar spaces, and that its rigidity is about 1/0000000000 that of steel; hence, that it is easily displaceable by a moving mass, that it is not discontinuous or granular, and hence that as a whole it may be compared to an impalpable and all pervading jelly through which Light and Heat waves are constantly throbbing, which is constantly being set in local strains and released from them, and being whirled in local vortices, thus producing the various phenomena of Electricity and Magnetism, and through which the particles of ordinary matter move freely, encountering but little retardation, if any, for its elasticity, as it closes up behind each moving particle, is approximately perfect. *A. Daniell*, Prin. of Physics, 208.

3. In *chem.*: (*a*) One of a class of organic bodies divided into two groups: (1) *Simple ethers*, consisting of two hydrocarbon radicals, alkyls, united by oxygen, and corresponding in constitution to the metallic oxids, as CH_3OCH_3, methyl ether, or methyl oxid, analogous to AgOAg, silver oxid. (2) *Compound ethers*, consisting of one or more alkyls or alcohol radicals and one or more acid radicals or acyls united by oxygen, and corresponding to salts of the metals, as $CH_3COO\,C_2H_5$, ethyl acetate, or acetic ether, corresponding to CH_3COONa, sodium acetate. Also called *esters*. (*b*) Specifically, ethyl oxid or ethyl ether ($(C_2H_5)_2O$, also called, but improperly, *sulphuric ether*, because prepared from a mixture of sulphuric acid and alcohol. Ether is a light, mobile, colorless liquid having a characteristic refreshing odor and burning taste. It is highly volatile and inflammable. It is chiefly used as an anesthetic agent, by inhalation. The ordinary ether of the United States Pharmacopœia consists of 74 per cent., and the stronger (ether fortior) of 94 per cent., of ethyl oxid.—**Acetic ethers.** See *acetic*.—**Benzoic, butyric, chloric, formic,** etc., **ether.** See the adjectives.—**Ether-engine.** See *engine*.—**Gelatinized ether,** in *med.*, ether shaken with white of eggs until it forms an opaline jelly. *U. The science of right conduct and character; the science which treats of the nature and grounds of moral obligation and of the rules which ought to determine conduct in accordance with this obligation; the doctrine of man's duty in respect to himself and the rights of others. Kant distinguishes between pure morals, or the science of the necessary moral laws of a free will, and *ethics* properly so called, which considers those laws as under the influence of sentiments, inclinations, and passions to which all human beings are more or less subject.

This fable seems to contain a little system of morality; so that there is scarce any better invention in all *ethics*.
Bacon, Fable of Dionysius.

Ethics may either be regarded as an inquiry into the nature of the Good, the intrinsically preferable and desirable, the true end of action, &c.: or as an investigation of the Right, the true rules of conduct, Duty, the Moral Law, &c. *H. Sidgwick*, Methods of Ethics, p. 2.

The Ethiopians of Homer are mythical; later the term came to imply a negro, a blackamoor, and popular etymology, followed by modern writers, derived the name from *αἴθειν*, burn (or *αἰθός*, burnt), + *ὄψ*, *ὤψ*, eye, face; as if 'the Burnt-Faces' (cf. *αἰθοψ*, fiery-looking, flashing, sparkling, fiery, hot, in LGr. also swart, black, < *αἰθός*, burnt, fiery, + *ὄψ*, face); but the form *Αἰθίοψ* would not result from such composition, and it is probably a corruption of some Egyptian or African original.] 1. Sieve-like; cribriform: in anatomy specifically applied to a bone of the skull. See II.—2. Specifically, pertaining to the ethmoid: as, the *ethmoid* region of the skull.

II. *n.* A bone of the cranium, situated in the middle line of the skull, in advance of the sphenoid, above the basicranial axis, transmitting the filaments of the olfactory nerve, and constituting the bony skeleton of the organ of smell: so called because, in the human subject and mammalia generally, it has a cribriform plate perforated with numerous holes for the passage of the olfactory nerves. The human ethmoid is comparatively small, of a cubical figure, with its cribriform plate horizontal. It consists of a median perpendicular plate or mesethmoid, and of the horizontal or cribriform plate, from which latter the main body of the bone depends on either side, forming the so-called lateral masses, or ethmoturbinals. The texture of these is extremely light and spongy, full of large cavities connecting with the frontal and sphenoidal sinuses, and lined with mucous membrane, the Schneiderian membrane, upon which the olfactory nerves ramify after leaving the cavity of the cranium through the holes in the cribriform plate. (See cut under *nasal*.) The so-called os planum of the ethmoid is simply the exterior surface of these lateral masses, which contributes to the inner wall of the orbit of the eye. The lateral masses are each partially divided into two, called the superior and middle turbinate bones, or scroll-bones (the inferior turbinate being a different bone), which respectively overlie the corresponding nasal meatuses. (See cut under *mouth*.) The ethmoid is wedged into the ethmofrontal notch of the frontal bone, and also articulates with the vomer, sphenoid, sphenoturbinals, nasals, maxillaries, lacrymals, palatals, and maxilloturbinals. It is developed from three ossific centers, one for the perpendicular plate, and one for each lateral mass. In other animals the ethmoid exhibits a wide range of variation in size, shape, and connections, and below mammals loses much or all of the particular characters it presents in man. (See cut under *Esox*.) It is relatively larger and more complicated in mammals of keen scent, as carnivores and ruminants.

Etruscan (ē-trus′kąn), *a.* and *n.* [< L. *Etruscus,* Etrurian (pl. *Etrusci,* the Etrurians), < *Etruria,* Etruria. Hence ult. *Tuscan,* q. v.] **I.** *a.* Pertaining or relating to Etruria, an ancient country in central Italy, bordering on the part of the Mediterranean called the Tyrrhenian sea, between Latium and Liguria (including modern Tuscany), or to its inhabitants, and especially to their civilization and art. These, before Hellenic influence was actually felt in Etruria, resembled in many ways those of primitive Greece. Compare *Tuscan.*—**Etruscan art,** the art of ancient Etruria; an artistic development believed with probability to have grown up independently from the same root as the art of Greece, but far inferior in every way to Greek art, though in its later stages influenced by it. Etruscan masonry closely resembles the Greek in its progress from the massive polygonal to admirable rectangular work in even courses; the arch and the vault were consistently employed, and were passed on to become the characteristic feature of Roman architecture; while the Etruscan house of rectangular plan with central court was the prototype of the Roman house. (See *Tuscan order,* under *Tuscan.*)

Etruscan Art.—Etruscan Sarcophagus in terra-cotta, from Chiusi: period of full development.—Museo Egizio, Florence.

The best works of Etruscan sculpture were its strongly colored terra-cotta statues, of life-size and larger, and its sarcophagi of terra-cotta bearing reclining figures on their lids, showing, however, but little anatomical truth, despite much research in details of dress and ornament. The native Etruscan jewelry exhibits massiveness and intrinsic value, as in heavy and complicated chains, pendants, and the like, in preference to the delicacy and artistic refinement of the imported Greek and Phenician examples found with the native productions in the tombs. See *bulla.*—**Etruscan pottery.** (*a*) The pottery of the ancient Etruscans, which may be roughly divided into four main classes: (1) the early cinerary urns, called *Canopic vases,* with covers in the form of human heads (see *Canopic*); (2) the black, unglazed ware, with ornamental figures and designs, impressed or in low relief, called *bucchero* or *bucchero nero vases* (see *bucchero*); (3) the painted vases imitated more or less closely from those of Greek manufacture; (4) the vases coated with a brilliant black varnish, and bearing reliefs, called *Etrusco-Campanian* (which see). (*b*) An epithet erroneously applied to Greek painted vases. This application, originating in the eighteenth century, before the study of archæology had made much advance, is still in use among persons whose ideas about these subjects are obtained from books. Wedgwood had this use in mind when he named his works *Etruria.*—**Etruscan ware,** a pottery made by a person named Dillwyn, at Swansea in Wales, about 1850, and decorated with figures, borders, etc., of classical design, usually in black or red. This ware was known as *Dillwyn's Etruscan ware,* and these words were printed in black on the bottom of each piece. *Jewitt.*

II. *n.* 1. An inhabitant of Etruria; a member of the primitive race of ancient Etruria. The Etruscans were distinguished ethnologically from all neighboring races, and their affinities are unknown, though there were similar people in ancient Rhætia, Thrace, etc. They called themselves *Rasena,* and the Greeks called them *Tyrrhenians,* between which and *Etruscans* there is probably a philological connection. See *Tyrrhenian.*

2. The language of the Etruscans, which from its few remains appears to have been unlike any other known tongue. It was spoken by many people in Italy outside of Etruria, till gradually superseded by Oscan and Latin; but a form of it continued in use in Rhætia (the Grisons and Tyrol) several centuries longer.

Etrusco-Campanian (ē-trus″kō-kam-pā′ni-an), *a.* Pertaining to Etruria and Campania, of ancient Italy.—**Etrusco-Campanian pottery,** the latest class of Etruscan pottery, made also in Campania, in the third century B. C. and later. The vases of this class are coated with a brilliant black varnish, present a great diversity of forms, and, like the older bucchero vases, affect shapes more appropriate to metal than to clay. All bear ornament in relief, from simple ribs or flutings to medallions, groups of figures, etc.

Breeches, quasi bear-riches; when a gallant bears all his riches in his breeches.—Most fortunately *etymologized!*
B. Jonson, Cynthia's Revels.

The habit of *etymologizing* words off-hand from expressive sounds, by the unaided and often flighty fancy of a philologer. *E. B. Tylor*, Prim. Culture, I. 147.

etymology (et-i-mol'ō-ji), *n.*; pl. *etymologies* (-jiz). [Early mod. E. *etymologie, etimologie;* = G. *etymologie* = Dan. Sw. *etymologi*, < F. *etymologie*, now *étymologie* = Sp. *etimología* = Pg. *etymologia* = It. *etimologia*, < L. *etymologia*, ML. also *etimologia, ethimologia*, < Gr. ἐτυμολογία, the analysis of a word so as to find its origin, etymology (translated *notatio* (see *notation*) and *veriloquium* (see *veriloquent*) by Cicero, and *originatio* (see *origination*) by Quintilian), < ἐτυμολόγος, studying etymology, telling the true origin of a word (as a noun, an etymologist), < ἔτυμον, the true literal sense of a word according to its origin, its etymology, + *-λογία*, < λέγειν, speak, tell: see *etymon* and *-ology.*] 1. That part of philology which treats of the history of words in respect both to form and to meanings, tracing them back toward their origin, and setting forth and explaining the changes they have undergone.

Etymology treats of the structure and history of words. It includes classification, inflection, and derivation.
F. A. March, Anglo-Saxon Grammar, p. 33.

Specifically—2. The particular history of a word, including an account of its various forms and senses. In its widest sense, the etymology of a word includes all its variations of form and spelling, and all its different meanings and shades of meaning, from its first appearance in the language to the present time, and, further, the same facts concerning the original or the cognate forms of the word in other languages. This would be impracticable for any large number of words, and accordingly the fullest etymologies, as in this dictionary, give but one form or a few typical forms for a given period of a language, or but one form for the whole period of the language, with a like summary treatment of the meanings, a more complete exhibition of forms and meanings being given only at critical or important points in the history. In a very restricted but common acceptation, the word implies merely the "derivation" of the word, namely, the mention of the word or root from which it is derived, as when *bishop* is said to be "from Greek ἐπίσκοπος," or *chief* "from Latin *caput.*"

Expoundinge also and declaringe the *etimologie* and native signification of suche wordes as we have borowed of the Latines or Frenche menne, not evyn so comonly used in our quotidiene speche.
Quoted in *Babees Book* (E. E. T. S.), p xxi.

This terme [barbarous] being then so vsed by the auncient Greekes, there haue bene since, notwithstanding, who haue digged for the *Etimologie* somewhat deeper, and many of them haue said that it was spoken by the rude and barking language of the Affricans now called Barbarians. *Puttenham*, Arte of Eng. Poesie, p. 210.

Before attempting an *etymology*, ascertain the earliest form and use of the word; and observe chronology. Observe history and geography; borrowings are due to actual contact. Observe phonetic laws.
Skeat, Etym. Dict., Pref., p. xxi.

Those *etymologies* which seemed strong because of likeness in sound, until it was shown that likeness in sound made them impossible. *George Eliot*, Middlemarch, II. 59.

3. In *gram.*, that division of grammar which treats of the parts of speech and their inflections.

etymon (et'i-mon), *n.* [= Sp. *étimo* = Pg. *etymon*, < L. *etymon*, < Gr. ἔτυμον, the true literal sense of a word according to its origin, its etymology, its primitive form or root; prop. neut. of ἔτυμος (also in lengthened form ἐτήτυμος, both chiefly poetical), true, sure, real; with formative *-μος*, akin to ἐτεός, true, real, genuine, ὅσιος, hallowed, sacred, holy, pious, devout (= Skt. *satyas*, true); cf. ἑτάζειν, examine, test; the root **ετ* being ult. a reduced form of **σεντ, *sant*, which appears in ὤν (ὀντ-), dial. ἐών (ἐοντ-) (= L. *ens* (*ent-*), orig. *sens* (*sent-*), as in *absens*, absent, *præsens*, present), ppr. of εἶναι, be, = AS. *sōth* (orig. **santh*), E. *sooth* = Icel. *sannr*, true, sooth: see *sooth*, and *ens, entity, ontology*, etc., and *am* (under *be*[1]), which represents the orig. root of all these words. Hence *etymology*, etc.] 1. The original element of a word; the root or primitive.

eu-. [L., etc., *eu-*, < Gr. εὐ-, a very common prefix, being the stem of the old adj. εὐς (dial. ἠύς), good, brave, noble, neut. acc. εὖ, later εὐ (dial. ἠύ), as an adv., well; prob. orig. **ἐσύς*, < √ **εσ* (= Skt. √ *as*), be, in εἶναι, be: see *am* (under *be*[1]), *etymon*, etc. The prefix is strictly the stem of the adj., and not the adv. εὖ; but the distinction is slight, and is generally disregarded, the prefix being more conveniently referred directly to the adverb. The prefix is used in Greek primarily to form adjectives, the second element being usually a noun or verb root, and the compound being an adjective meaning 'with good . . .,' 'having good . . .,' 'well-' or 'easily ——ed,' as in εὐχειρ, having good (quick, dexterous) hands, well-handed, εὐφυής, well-grown, having a good nature, εὐώνυμος, having a good name, well-named, εὐάγγελος, bringing good news, etc.; such adjectives being often used as nouns, and often having abstract or other nouns derived from them.] A prefix of Greek origin, meaning 'good' (for the purpose) or, as used adverbially, 'well,' 'easily,' implying excellence, fitness, abundance, prosperity, facility, easiness. It is opposed to *dys-*, as in *eulogy, eupepsy*, opposed to *dyslogy, dyspepsy.* In *evangel* and its derivatives *eu-* has taken the form *ev-*, which also appears, less properly, in some recent New Latin formations.

The flowers are usually in axillary umbels, with a firm, deciduous, calyptra-like calyx, no petals, and very numerous stamens. The seeds are very small. The leaves are thick and smooth, mostly similar on both sides, and thrown into a vertical position by a twist of the petiole, glandular-punctate, and with a strong, peculiar odor. The matured wood is always hard, and the timber is often very valuable. Many of the arboreous species are very tall; and some, as *E. amygdalina* and *E. diversicolor*, reach a height of over 400 feet, exceeding in this respect all other known trees. Many species exude a gum (a kind of kino), whence the common name of *gum-tree.* From the extreme hardness or the fibrous character of the bark, some are known as iron-bark or stringy-bark trees, and others are distinguished as mountain-ash, box-, or mahogany-trees, etc. *E. siderophloia*, which is the principal ironbark-tree, and *E. resinifera* are the chief source of Botany Bay kino. The leaves of various species, especially of *E. Globulus*, and the oil extracted from them, are said to have important remedial powers in asthma, bronchitis, and various other diseases. The trees are of very rapid growth, and several species, especially the blue-gum, *E. Globulus*, have been extensively planted in warm countries for their timber. There is a popular belief that their culture in malarial districts counteracts miasmatic influences. See *fever-tree.*

★**euchre** (ū′kėr), *n.* [Sometimes written *eucre*; the spelling is evidently corrupt. If of G. origin, as sometimes said (with some probability; cf. *bower*[6] in this game, of G. origin), it would perhaps represent a LG. form **juker*, but no connection is made out. Cf. G. *jucks*, a joke (= E. *joke*), with E. *joker*, a certain card; LG. *juch-hei*, a merry company, an exclamation of boisterous joy, = MHG. *juch*, ⟩ G. *jauchzen*, shout.] 1. A game of cards played by two, three, or four persons with the 32, 28, or 24 highest cards of the pack. Five cards are dealt to each player, two and then three at a time, or three and then two, and one to mark trumps is turned face up; the eldest hand has the right either of ordering this card into the dealer's hand, who discards another, and then playing the game, or of "passing"—that is, doing nothing; likewise the second and third hands if more than two play; should all pass, the dealer can take up into his hand the trump card, or can pass, which he does by turning down the card which had been turned face up; if the latter, the eldest hand either names a new suit as trumps, the game being then played through, or passes again. Should he pass, the second hand, the third hand, and the dealer in turn have the same right of naming the trump or passing. If all pass on this second round, then a new deal is made by the hand next in order. In playing the hands, each player throws one card, following suit if possible, and the highest card takes the trick; the winning of three tricks counts one, of five tricks two; should a player on one side or her up, take up, or name the trump and fail to secure at least three tricks, that side is euchred, and its opponent scores two. The cards rank from ace through king, queen, etc., to the lowest card used, except in trumps, where the knave, known as the right bower, is the highest, and the other knave of the same color, or left bower, is the next highest. Sometimes an additional card, called the *joker*, which is the highest of all the cards, is used. See *railroad euchre*, in the supplement.

2. The winning of at least three tricks in a hand, in a game of euchre, from the side which makes the trump: as, that is a *euchre*.—**Cut-throat euchre**, three-handed euchre, in which one person plays against the other two together.—**French euchre**, a variety of the game of euchre played by four persons with the 24 highest cards of the pack. Each player, in turn, has the right of bidding, or offering to take a certain number of tricks, and that one who bids highest names the trump. The game then proceeds as in four-handed euchre. If the bidding player and his partner take the number of tricks proposed, they add that to their score; if not, their opponents do.—**Progressive euchre**, a series of games of euchre played by three or more sets of four persons each. All the sets begin playing at the same time, and when those at the first or "head" table finish, those at the other tables must stop playing. Those who win or are ahead score one, and are advanced to the next table, except those already at the head table, who stay where they are. Those who lose or are behind stay where they are, except when at the first table, in which case they go back to the last or "booby" table. All who lose while at the last table score one as "boobies." At the end of the play prizes are given.—**Six-handed or bid euchre**, a variety of the game of euchre played by six persons (three on a side), with the joker and the 29, 32, or 34 highest cards of the pack. That player who bids or offers to make the most points names the trump. The game then proceeds as in four-handed euchre. If the player who bids and his partners secure the number of points proposed, they add it to their score; if not, it is counted for their opponents. When more than 30 cards are used, those not dealt are placed face down on the table, and are called "the widow"; the player who names the trump has the privilege of selecting such of them as he may wish, and using them in place of others discarded from his hand.

E. viridis* is one of the commonest and best-known of infusorians, inhabiting stagnant pools, often occurring in vast shoals on the surface of the water. *Ehrenberg,* 1832.

euglenid (ū-glen′id), *n.* An infusorian of the family *Euglenidæ.*

Euglenidæ (ū-glen′i-dē), *n. pl.* [NL., ⟨ *Euglena* + *-idæ.*] A large family of monomastigate eustomatous flagellate infusorians, typified by the genus *Euglena,* highly diversiform or metabolic, with brilliant, usually green, endoplasm. These remarkable animalcules form a natural family, whose bright colors (for the most part green, though sometimes red) and peculiar endogenous multiplication (noted below) are highly characteristic. They vary much in the different genera, being free-swimming or sedentary, naked or loricate, and solitary or colonial. The flagellum is single and terminal; the oral aperture is distinct; the endoplasm often contains highly refractive particles of apparently amylaceous substance; one or more eye-like pigment-specks are often developed at the anterior end; and the contractile vacuole and the endoplast are conspicuous, the former usually located close to the anterior border. The euglenids multiply both by longitudinal and transverse fission, by the subdivision of the body-substance into sporular elements, and by the development of independent germinal bodies out of the substance of the endoplast. The sporulation, or breaking up of the colored endoplasm, usually consequent upon a process of encystment, results in the formation of germs variable in number and of irregular contour, released as small green amœbiforms, without trace of the flagellum, oral aperture, or pigment-spot, which are subsequently acquired. The fusiform zoöids resulting from the sporulation of the endoplasm of motile euglenids, on the contrary, appear to be usually furnished with a flagellum and an eye-speck. Another form of encystment, not connected with reproduction, occurs in euglenids when the water dries up in the ponds or ditches where they live. The animalcules become spherical and quiescent, develop a gelatinous covering which indurates, and in this condition have been mistaken for green algals. These several changes of the animalcule give rise to the term *euglenoid,* applied to other organisms, as gregarines, which present similar conditions of encystment and sporulation. According to Saville Kent, the genera composing the family as at present recognized are *Euglena, Amblyophis, Phacus, Chloropeltis, Trachelomonas, Rhaphidomonas, Cœlomonas, Ascoglena,* and *Colacium.* Nearly all occur in fresh water, especially when stagnant, though a few are found in brackish water. They may be single or in small groups, or may form very extensive colonies.

=Syn. 1. *Encomium*, *Eulogy*, *Eulogium*, *Panegyric*. These words are best understood through their history. (See the derivations.) *Eulogy* is stronger than *encomium*, but still is the most general word. An *encomium* is an expression of warm praise, of some fullness and completeness, like the ancient laudatory ode: *encomium* is not a distinctive name for a set speech; the others may be: as, Everett's *Eulogy* upon the Pilgrim Fathers; the *Panegyric* of Isocrates. *Eulogium* is only a more formal word for *eulogy*. The last three may be used abstractly, but not *encomium;* we may say, it was mere *eulogy* or *panegyric*, but not mere *encomium*. *Eulogy*, *a eulogy*, and *an encomium* may be tempered with criticism; *panegyric* and *a panegyric* are only praise; hence, *panegyric* is often used for exaggerated or undiscriminating praise.

Plutarch assures us that our author [Cicero] . . . made a speech in public full of the highest *encomiums* on Crassus.

Americanus*, known respectively as the *wahoo* or *burning-bush* and the *strawberry-bush*. *E. eupatory (ū′pạ-tō-ri), *n.* Same as *eupatorium*, 2.

eupatrid (ū-pat′rid), *n.* and *a.* **I.** *n.* One of the Eupatridæ.

At the beginning of Athenian history we find the Athenian commonalty the bondslaves, through debt, of the *Eupatrids*. *Maine*, Early Hist. of Institutions, p. 167.

The honour given to the heads of the houses, which everywhere formed the primary mould of the Aryan community, . . . was certainly one great source of nobility. This was the patent, so to speak, of the Roman patrician, of the Greek *eupatrid*, of the Teutonic warrior.
Edinburgh Rev.

II. *a.* Of or pertaining to the Eupatridæ.

Just as a Roman or Athenian noble, settled at any point of the Ager Romanus or the Attic territory, would still count himself a member of his patrician house or *eupatrid* tribe. *Maine*, Early Law and Custom, p. 271.

Eupatridæ (ū-pat′ri-dē), *n. pl.* [< Gr. *εὐπατρίδης*, born of a noble father, of noble family; pl. *Εὐπατρίδαι*, the Eupatridæ; < *εὖ*, well, + *πατήρ* = E. *father*.] The ancient aristocracy of Athens and other Greek states, in whom, in primitive times, were vested the privileges and powers of lawgivers, the lower classes having no voice. Saturday Rev., March 2, 1877, p. 351.

It is of uncertain affinities, and is sometimes brought under the family *Timeliidæ*, sometimes made type of *Eupetidæ*, in which

Eupetes macrocercus.

the grallatorial genus *Mesites* has been placed, there being some superficial resemblance between these two genera. It appears to be nearest the *Crateropodidæ*, or true babbling thrushes. The bill is long, the neck extremely slender, and covered like the head with short, velvety feathers. The type species, *E. macrocercus*, inhabits the Malay peninsula and Sumatra; *E. cærulescens* is found in New Guinea.

Eupetidæ† (ū-pet′i-dē), *n. pl.* [NL., < *Eupetes* + *-idæ*.] A highly unnatural association of the passerine genus *Eupetes* and the grallatorial genus *Mesites*, made by G. R. Gray in 1869.

Euphausia (ū-fạ-ö′si-ạ), *n.* [NL., appar. < Gr. *εὖ*, well, + *φαινειν* (√ **φα*), make to appear (cf. *εὐφαής*, very bright, < *εὖ*, well, + *φάος*, *φῶς*, light, < *φαίνειν* (√ **φα*), make to appear) (see *phantasm*, *fancy*), + *οὐσια*, substance.] A genus of schizopodous crustaceans or opossum-shrimps, typical of the family *Euphausiidæ*. *Dana*, 1850.

Euphausia leaves the egg as a true nauplius with its three pairs of appendages, a mouth being present, though the alimentary canal is not open at the posterior end. With succeeding moults new appendages are formed and the carapace outlined, while the abdomen does not make its appearance, except in a very rudimentary condition, until six appendages are outlined. A modified zoeal condition now ensues, from which the adult is gradually produced by a series of moults. *Stand. Nat. Hist.*, II. 43.

Euphausiidæ (ū″fa-ö-sī′i-dē), *n. pl.* [NL., < *Euphausia* + *-idæ*.] A family of opossum-shrimps, taking name from the genus *Euphausia*. Grass-parrakeet (*Euphema elegans*).

by Wagler in 1830. It contains such species as *E. elegans* and *E. pulchella*, and was made by G. R. Gray in 1840 to include such species as *E. discolor*. Also *Euphemia*.

euphemism (ū′fē-mizm), *n.* [< Gr. *εὐφημισμός*, euphemism, i. e., the use of an auspicious for an inauspicious word, < *εὐφημίζειν*, use a good for a bad, an auspicious for an inauspicious word, < *εὔφημος*, uttering sounds of good omen, abstaining from inauspicious words, < *εὖ*, well, + *φήμη*, a voice, a prophetic voice, rumor, talk (= L. *fama*, rumor, fame), < *φάναι*, speak, say: see *fame*, *fate*.] **1.** In *rhet.*, the use of a mild, delicate, or indirect word or expression in place of a plainer and more accurate one, which by reason of its meaning or its associations or suggestions might be offensive, unpleasant, or embarrassing.

This instinct of politeness in speech—*euphemism*, as it is called—which seeks to hint at an unpleasant or an indelicate thing rather than name it directly, has had much to do in making words acquire new meanings and lose old ones: thus 'plain' has usurped the sense of 'ugly'; 'fast,' of 'dissipated'; 'gallantry,' of 'licentiousness.'
Chambers, Inf. for the People.

2. A word or expression thus substituted: as, to employ a *euphemism*.

When it was said of the martyr St. Stephen that "he fell asleep," instead of "he died," the *euphemism* partakes of the nature of a metaphor, intimating a resemblance between sleep and the death of such a person.
Beattie, Moral Science, § 866.

euphemistic, euphemistical (ū-fē-mis′tik, -ti-kal), *a.* Pertaining to or characterized by euphemism.

A large genus of Central and South American tanagers, of the family *Tanagridæ*, giving name to a section *Euphoniinæ* of that family. *E. musica* is the organist-tanager of the West Indies. One species, *E. elegantissima*, is found on the borders of the United States; 31 others extend through the neotropical regions to Bolivia and Paraguay. Also called *Cyanophonia*, *Acroleptes*, *Iliolopha*, and *Phonasca*. Also written *Euphona*.

There are 4 genera, *Euphonia*, *Chlorophonia*, *Pyrrhuphonia*, and *Hypophœa*. Also *Euphoninæ*.

euphonious (ū-fō′ni-us), *a.* [< LL. *euphonia* (< Gr. *εὐφωνία*), euphony, + *-ous*. See *euphonous*.] Consisting of agreeable articulate elements; well-sounding; euphonic.

Euphonious languages are not necessarily easy of acquirement. The Fin, in which it is rare to find two concurrent consonants in the same syllable, is too fine and delicate for remembrance. The mind wants consonantal combinations, or something equally definite, to lay hold of. *Latham*, Elem. of Comp. Philol.

euphoniously (ū-fō′ni-us-li), *adv.* With euphony; harmoniously.

euphonism (ū′fō-nizm), *n.* [< Gr. *εὐφωνος*, euphonous (see *euphonous*), + *-ism*.] An agreeable sound or combination of sounds. *Oswald.* [Rare.]

A musical instrument, consisting of a set of glass tubes, connected with graduated steel bars, to be put in vibration by the moistened finger: invented by Chladni in 1790.—2. A musical instrument, the lowest or bass of the saxhorn family, having a compass of about three octaves upward from the second C below middle C. Its tone is powerful, but unsympathetic.

euphonize (ū′fō-nīz), *v. t.*; pret. and pp. *euphonized*, ppr. *euphonizing*. [< Gr. *εὐφωνος*, having a good voice, sweet-voiced, musical (see *euphonous*), + *-ize*.] To make euphonic or agreeable in sound.

The spreading of classical learning had not at first that general effect in *euphonizing* our language which might have been expected.
Mitford, Harmony of Language (1774), p. 174.

euphonous (ū′fō-nus), *a.* [< Gr. *εὐφωνος*, having a good voice (i. e., having a sweet voice, as a singer, e. g., the Muses, or having a loud, distinct voice, as a herald) (appar. not used with ref. to easy or agreeable pronunciation), < *εὖ*, well, + *φωνή*, voice, sound: see *euphony*.] Same as *euphonious*. *Mitford*.

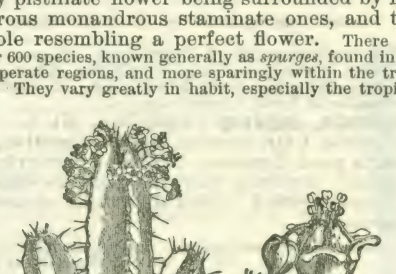
euphony (ū′fō-ni), *n.* [= F. *euphonie* = Sp. *eufonía* = Pg. *euphonia* = It. *eufonia*, < LL. *euphonia*, < Gr. *εὐφωνία*, the quality of having a good voice (i. e., a sweet or a loud voice), loudness of voice, euphony, < *εὔφωνος*, having a good voice: see *euphonous*.] 1. Easy enunciation of sounds; a pronunciation which is pleasing to the sense; agreeable utterance. As a principle active in the historical changes of language, *euphony* is a misnomer, since it is ease of utterance, economy of effort on the part of the organs of speech, and not agreeableness to the ear, that leads to and governs such changes.

Euphony, which used to be appealed to as explanation [of phonetic change], is a false principle, except so far as the term may be made an idealized synonym of economy [in utterance]. *Whitney*, Encyc. Brit., XVIII. 773.

2. Harmonious arrangement of sounds in composition; a smooth and agreeable combination of articulate elements in any piece of writing.

Euphony consists, also, in a well-proportioned variety of structure in successive sentences. A monotonous repetition of any construction can not be made euphonious, except by singing it. *A. Phelps*, Eng. Style, p. 327.

=Syn. *Euphony*, *Melody*, *Harmony*, *Rhythm*. *Euphony* in style respects simply the question of pleasing sounds in the words themselves. *Melody* respects the succession of sounds, especially as affected by the pitch appropriate to the thought and required by the arrangement of clauses. *Harmony* respects the adaptation of sound to sense. *Rhythm* respects the emphasis—that is, the succession of emphatic and unemphatic syllables. In music *melody* respects the agreeable combination of successive sounds of various pitch, while *harmony* respects the agreeable blending of simultaneous sounds of different pitch, the sounds in either case being from voices or musical instruments; thus, a song for children to sing must depend for its effect upon *melody* rather than *harmony*.



The Attic *euphony* in it, and all the aroma of age.
D. G. Mitchell, Wet Days.

The river that I sate upon
It made such a noise as it ron,
Accordaunt with the birdes *armony*,
Me thought it was the beste *melody*
That mighte ben yheard of any mon.
Chaucer, Cuckoo and Nightingale, l. 81.

By the *harmony* of words we elevate the mind to a sense of devotion, as our solemn musick, which is inarticulate poesy, does in churches. *Dryden*, Tyrannic Love, Pref.

Ourself have often tried
Valkyrian hymns, or into *rhythm* have dash'd
The passion of the prophetess.
Tennyson, Princess, iv.

Euphorbia (ū-fôr′bi-ạ), *n.* [NL. (L. *euphorbea* and *euphorbeum*), < Gr. *εὐφόρβιον*, an African plant, also its juice (*euphorbium*, q. v.), said to be named from *Euphorbus*, Εὔφορβος, physician to the king of Mauretania. The name Εὔφορβος is prop. an adj., *εὐφορβος*, well-fed, < *εὖ*, well, + *φέρβειν*, feed.] 1. The typical genus of the family *Euphorbiaceæ*, characterized by having its achlamydeous, unisexual flowers within a cup-shaped, calyx-like involucre, the central solitary pistillate flower being surrounded by numerous monandrous staminate ones, and the whole resembling a perfect flower. There are over 600 species, known generally as *spurges*, found in all temperate regions, and more sparingly within the tropics. They vary greatly in habit, especially the tropical species, which are sometimes shrubs or trees; and many African species have succulent, leafless, spiny, and angled stems, resembling columnar *Cactaceæ*. They abound in an acrid milky juice, which possesses active medicinal and sometimes poisonous properties. The blooming spurge, *E. corollata*, and the ipecac spurge, *E. Ipecacuanhæ*, of the United States, and numerous other species, are employed medicinally in the countries where they are native. (See *euphorbium*.) Various species are also cultivated for ornament, as *E. marginata* for its color-margined leaves, *E. fulgens* for its bright-red involucre, and several African species for their cactus-like habit, as *E. resinifera*.

Top of Stem of *Euphorbia resinifera*.
a, involucre with inclosed flowers; *b*, section of same.

2. [*l. c.*] A plant of this genus.

The name *Euphues* (prop. **Euphyes*) is taken from Gr. *εὐφυής*, well-shaped, of good natural disposition, naturally clever (*ὁ εὐφυής*, a man of genius), etc., < *εὖ*, well, + *φυή*, growth, stature, nature, < *φύειν*, produce, pass. *φύεσθαι*, grow.] In *Eng. lit.*, an affected literary style, originating in the fifteenth century, characterized by a wide vocabulary, alliteration, consonance, verbal antithesis, and odd combinations of words. The style, although bombastic and ridiculous originally, contributed to the flexibility and verbal resources of later English. It assumed its most extreme form in the works of John Lyly, called the Euphuist.

All our Ladies were then his [Lyly's] Scholars; and that Beauty in Court which could not Parley *Eupheisme* was as little regarded as She which now there speaks not French.
Edward Blount, in Lyly's Euphues, Epist. to Reader.

The discourse of Sir Piercie Shafton, in "The Monastery," is rather a caricature than a fair sample of *euphuism*. . . . Perhaps, indeed, our language is, after all, indebted to this writer [Lyly] and his *euphuism* for not a little of its present euphony. *Craik*, Hist. Eng. Lang., I. 495.

So far, then, there is in the father of *euphuism* [Lyly] nothing but an exaggerated developement of tastes and tendencies which he shared not only with a generation of writers, but with the literary currents of a century, indeed of more centuries than one.

A. W. Ward, Eng. Dram. Lit., I. 156.

The all-seeing poet laughs rather at the pedantic schoolmaster than at the fantastic knight; and the *euphuistic* pronunciation which he makes Holofernes so malignantly criticise was most probably his own and that of the generality of his educated contemporaries.

Craik, Hist. Eng. Lang., I. 473.

The *euphuistic* style was an exaggeration of the "Italianating" taste which had begun with the revival of our poetical literature in the days of Henry VIII., but to which Lyly was the first to give full expression in prose.

A. W. Ward, Eng. Dram. Lit., I. 157.

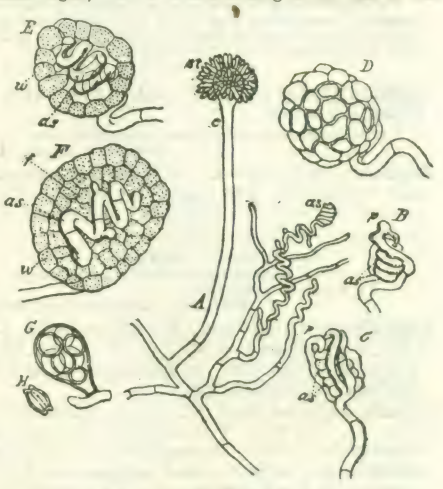
Fortnightly Rev., N. S., XLI. 332.

Europeanization (ū-rō-pē″an-i-zā′shon), *n.* [< *Europeanize* + *-ation.*] The process of making or becoming European.

Everything is thus already provided for the opening out and complete *Europeanization* of North Africa, except the colonists. *Contemporary Rev.*, LIII. 534.

Europeanize (ū-rō-pē′an-īz), *v. t.*; pret. and pp. *Europeanized*, ppr. *Europeanizing.* [< *European* + *-ize.*] To make or cause to become European; assimilate to Europeans in any respect, or bring into a condition characteristic of Europe: as, a *Europeanized* Hindu.



Without being *Europeanized*, our discussion of important questions in statesmanship, political economy, in æsthetics, is taking a broader scope and a higher tone. *Lowell*, Study Windows, p. 78.

A few of the streets [in Moscow] have been *Europeanized* — in all except the paving, which is everywhere execrably Asiatic. *D. M. Wallace*, Russia, p. 409.

Europeo-Asiatic (ū-rō-pē″ō-ā-shi-at′ik), *a.* In *phytogeog.*, pertaining to Europe and Asia; palæarctic.

Under the name of *Europæo-Asiatic* or North temperate and Mountain region of the Old World, I would designate that vast area extending from the Atlantic to the North Pacific. *G. Bentham*, Notes on Compositæ, p. 542.

Eurotium (ū-rō′shi-um), *n.* [NL., < Gr. εὐρώς (εὐρωτ-), mold, dank, decay.] A genus of pyrenomycetous fungi, belonging to the *Perisporiaceæ*, and closely related to the *Erysiphaceæ.* The fructification consists of yellow closed perithecia, each containing numerous asci, which inclose eight spores. In this genus the process of reproduction in ascomycetous fungi may be observed. A portion of a mycelial thread assumes a spiral form and constitutes the female organ, while a branch arising at the base of the

Eurotium repens, highly magnified.

A, a small portion of the mycelium with a conidiophore (*c*), terminated by the sterigmata (*st*), from which the spores have fallen, also with the spiral female organ, the ascogonium (*as*). *B*, the spiral ascogonium (*as*) with the antheridium (*p*). *C*, the same beginning to be surrounded by threads, out of which the wall of the perithecium is formed. *D*, a perithecium. *E*, *F*, sections of young perithecia: *w*, cells composing the wall; *f*, false parenchyma underneath the wall; *as*, ascogonium. *G*, ascus. *H*, an ascospore. (From Sachs's "Lehrbuch der Botanik.")

spiral becomes the male organ. After fertilization these organs and some additional branches develop into the perithecium and its contents. There is also a conidial fruit, which is a gray mold. It consists of erect hyphæ, each terminated by a capitate enlargement upon which numerous sterigmata are situated; each of the latter bears a chain of spores. This was formerly considered a distinct fungus, known as *Aspergillus.* *Eurotium* with its conidial form is a common mold which grows on a great variety of substances, especially dead herbs and jellies.

It is the communication between the cavity of the tympanum and that of the mouth. Morphologically, this tube is a part of the remains of the primitive visceral cleft of the embryo which places the mouth in direct communication with the exterior through the ear. Were it not for the membrane of the tympanum or ear-drum, which stops up the passage, there would be nothing to prevent the passage of a sufficiently slender and flexible probe from the mouth through the Eustachian tube, tympanum, and external meatus of the ear, and the passage would correspond to that of a twig or the finger into a fish's mouth and out through one of the gill-slits. In man the Eustachian tube is 1½ to 2 inches long, directed downward, forward, and inward from the tympanum to the fauces. It is formed partly of bone, partly of gristly and fibrous tissue. The bony part, about half an inch long, is included in the temporal bone, between its squamosal and petrosal portions. The cartilaginous part is about an inch long, formed of a scroll-like piece of fibrocartilage, the interval between whose edges is completed by fibrous tissue. It is trumpet- or funnel-shaped, and ends by an oral orifice at the upper back part of the pharynx, a little to one side of the median line, and nearly opposite the middle meatus of the nose. The mucous membrane of the pharynx continues directly through the tube, and is covered with ciliated epithelium. See cut under *ear*.—**Eustachian valve**, a semi-lunar membranous fold in the right auricle of the heart, between the mouth of the inferior vena cava and the auriculoventricular aperture, serving to direct the course of the blood.

Alloys are regarded as eutectic compounds, and the same principles apply to the mixtures of fused silicates of which volcanic glass, slags, etc., are formed.

Metallic alloys are true homologues of the cryohydrates; the ratios in which metals unite to form the alloy possessing the lowest melting-point are never atomic ratios, and when metals do unite in atomic ratios the alloy produced is never *eutectic*, i. e. having a minimum solidifying point. Thus pure cast-iron is not a carbide of iron, but an *eutectic* alloy of carbon and iron. Similar hyperchemical mass ratios are found to exist among anhydrous salts; when one salt fused per se acts as a solvent to another salt, forming *eutectic* salt alloys, similar to *eutectic* metallic alloys and the cryohydrates. *F. Guthrie*, Nature, XXXIII. 21.

The process of evaporation is constantly going on at the surface of all liquids. In the case of the sea and other bodies of water, the vapor thus formed rises to considerable heights above the earth's surface, and afterward, by a partial condensation, forms clouds, and finally descends in rain. The effect of evaporation is to reduce the temperature of the evaporating surface, and the evaporation of certain volatile liquids, such as ether, produces an intense degree of cold. Evaporation (boiling down) is often practised on fluids, especially in chemistry, pharmacy and cookery, in order to reduce them to a denser consistence, or to obtain in a dry and separate state the fixed matters contained in them. Evaporation of solids such as snow, solid CO_2, etc., likewise occurs.

So in pestilent fevers, the intention is to expel the infection by sweat and *evaporation*. *Bacon*, Nat. Hist., § 968.

3. In *fencing*, the avoiding of a thrust by moving the body without changing the position of the feet. *Rolando* (ed. Forsyth). = **Syn.** *Evasion, Equivocation, Prevarication, Shift, Subterfuge*, quibble, all express artful or dishonorable modes of escaping from being frustrated or found out. The first three imply the use of language; *shift* and *subterfuge* may be by words or actions. *Evasion* in speech may be simply avoiding, as by turning the conversation or meeting one question with another. *Equivocation* is using words in double and deceptive senses. *Prevarication* may be in action, but is properly understood to be in words; it includes all tricks of language that fall short of downright falsehood; it is, literally, a stepping on both sides of the truth; the word is a strong one. All these words convey opprobrium in proportion to the amount of insincerity implied. *Shift* and *subterfuge* may be modes of *evasion; shift*, a thing turned to as a mean expedient, a trick; *subterfuge*, a place of hiding, hence an artifice. *Shift* does not necessarily express a dishonorable course, and *evasion* and *subterfuge* are often lightly used. See *artifice* and *expedient*, *n.*

2. In *astron.*: (*a*) The second lunar inequality, described by Ptolemy. It comes to its maximum value at the quadratures, and disappears at the conjunctions and oppositions. Ptolemy accounted for it by supposing that the apogee of the moon's orbit or deferent of its epicycle recedes to the west at a uniform angular rate of 11° 2′ per diem, while the center of the epicycle advances to the east at a uniform angular rate of motion about the earth of 13° 11′, the mean sun always bisecting the arc of the zodiac between the lunar apogee and the center of the lunar epicycle. This theory represented the longitudes with remarkable accuracy, but was utterly inconsistent with the most obvious observations respecting the moon's apparent diameter. In modern astronomy the evection is a periodical disturbance by the sun of the eccentricity of the moon's orbit. This is greatest when the line of syzygies coincides with the line of apsides (about twice a year), displacing the moon at times by about 1° 20′,—which may alter the time of an eclipse by nearly 3 hours.

The *evidence* of a deeply interested witness, given on the side which his interest would incline him to give it, is of no value when the circumstances are such that he cannot be contradicted on the subject-matter of his *evidence.* *Nineteenth Century*, XX. 456.

(*d*) In a more restricted sense, that part of such information or testimony which is properly receivable or has actually been received by the court on the trial of an issue: sometimes more specifically characterized as *judicial evidence:* as, that is not *evidence*, my lord; the age of the accused is not in *evidence.* In this latter sense sometimes, especially in equity practice, spoken of as the *proofs.* (*e*) The rules by which the reception of testimony is regulated in courts of justice: as, a treatise on *evidence;* professor of pleading and *evidence.*—**Adminicular, circumstantial, conclusive, cumulative, extrinsic, hearsay**, etc., **evidence.** See the adjectives.—**Demurrer to evidence.** See *demurrer*[2].—**Direct evidence**, that which goes expressly to the very point in question; that which, if believed, proves the point without aid from inference or reasoning, as the testimony of an eye-witness to an occurrence, as distinguished from *indirect* or *circumstantial evidence*, which goes expressly to other facts only, from which it is proposed to infer what was the fact on the point in question.—**Documentary evidence**, evidence supplied by written instruments.—**Documentary Evidence Act**, an English statute of 1868 (31 and 32 Vict., c. 37), making all laws, proclamations, and other official documents which purport to be printed in the *Gazette* or by the government printer, or certified by the clerk of the Privy Council, and also, by an amendment in 1882 (45 Vict., c. 9), if they purport to be printed by authority of Her Majesty's Stationery Office, receivable in evidence without further proof.—**Evidence aliunde.** See *aliunde.*—**Evidences of Christianity.** See *Christianity.*—**Formal evidence**, the character of the act of reason by which anything is recognized as certain and indubitable.—**Immediate evidence**, that state or degree of evidentness which belongs to an object plainly perceived.—**In evidence.** (*a*) In *law*, having been received by the court as competent evidence in the cause on trial; being a part of the accepted proofs. (*b*) Plainly visible; conspicuous: a recent phrase adopted from the French *en évidence.*—**Instruments of evidence**, the media, such as witnesses, documents, etc., through which the evidence of facts is conveyed to the mind of a judicial tribunal. *Best.*—**King's evidence, queen's evidence, state's evidence**, one charged with a crime who waives his privilege against criminating himself in order that his testimony as a witness may be used to convict another implicated with him.—**Law of evidence**, that part of the law which determines the necessity, the methods, and the sufficiency of proof of facts as a basis for the administration of justice. It is a system consisting partly of principles and partly of artificial rules, established partly by precedent and partly by statute, and originating partly in logical principles and partly in judicial experience in investigating controversies by means of human testimony; the object of the system being to guide courts in deciding what subjects require proof, what facts are to be received as evidence, what testimony or documents may be used for the purpose and in what manner, and what the effect of evidence thus received should be.—**Mediate evidence**, the clearness and force of a demonstration.—**Moral evidence**, the evidence of an irresistible probable argument.—**Negative evidence.** See *positive evidence.*—**Objective evidence**, the character of the object of a certain and indubitable cognition.—**Opinion evidence.** See *opinion.*—**Oral evidence, parole evidence**, evidence by word of mouth; testimony, as distinguished from documentary evidence. Testimony taken by deposition, and thus presented in writing, is deemed oral evidence, not documentary evidence.—**Positive evidence.** (*a*) Direct evidence (which see, above). (*b*) Testimony to having witnessed an act or event, as distinguished from *negative evidence*, or the testimony of a witness who was present and observant, that such act or event did not take place. As between equally credible witnesses, positive testimony is entitled to more weight than negative, because it may be that one witness, though present, did not see or hear that which another witness did.—**Presumptive evidence, prima facie evidence**, evidence sufficient if not controverted: used technically in two distinct senses which are often confused—(*a*) Evidence sufficient to go to the jury, and on which therefore it would be error for the judge to decide in place of the jury, but on which the jury may fairly decide either way. (*b*) Evidence sufficient not only to go to the jury, but to require them to find accordingly if no credible contrary evidence be given.—**Primary evidence**, the best evidence, as distinguished from *secondary evidence;* or evidence of such a nature as to imply (unless explanation is given) that better evidence exists and is kept back. Thus, if it is sought to prove the contents of a written contract, the instrument itself is the best evidence of the contents, and it must be produced, or satisfactory excuse must be given, before witnesses can be allowed to testify what the contents were. But among such witnesses the testimony of the writer of it, though more satisfactory than that of others, is not therefore deemed the best or primary evidence in the technical sense.—**Real evidence**, the evidence afforded by inspection or actual examination of the person or thing by the court or jury, when the question involves the condition of such person or thing.—**Satisfactory evidence**, or **sufficient evidence**, such evidence as in amount is adequate to justify the court or jury in adopting the conclusion in support of which it is adduced.—**Secondary evidence**, evidence not primary, but which may be admitted upon showing proper reasons for failure to obtain primary evidence.=**Syn.** *Testimony*, *Evidence*, *Proof*, *Exhibit*, deposition, affidavit. In law, *testimony* is evidence given by witnesses. *Evidence* is the broader term, including that which is given by witnesses or afforded by documents or by the inspection of the person or object itself. *Proof* is the effect of evidence in establishing the conclusion of fact to support which it is adduced. *Proofs* are the evidence in a cause, including testimony and documents. Hence—**2.** The process of evolving or becoming developed; an unfolding or growth from, or as if from, a germ or latent state, or from a plan; development: as, the *evolution* of history or of a dramatic plot.

The whole *evolution* of ages, from everlasting to everlasting, is so collected and presentifickly represented to God at once, as if all things which ever were, are, or shall be, were at this very instant really present.

W. R. Bowditch, Coal Gas, xi. 21.

Specifically—(*a*) In *biol.*: (1) The actual formation of a part or of the whole of an organism which previously existed only as a germ or rudiment; ordinary natural growth, as of living creatures, from the germinal or embryonic to the adult or perfect state: as, the *evolution* of an animal from the ovum, or of a plant from the seed; the *evolution* of the blossom from the bud, or of the fruit from the flower; the *evolution* of the butterfly from the caterpillar; the *evolution* of the brain from primitive cerebral vesicles, or of the lungs from an offshoot of the intestine. (2) The release, emergence, or exclusion of an animal or a plant, or of some stage or part thereof, from any covering which contained it: as, the *evolution* of spores from an encysted animalcule; the *evolution* of a moth from the cocoon, of an insect from the wood or mud in which it lived as a larva, of a chick from the egg-shell which contained it as an embryo.

The parasite is often taken for the Hessian fly. . . . Many have been deceived by the specious circumstance of its *evolution* from the pupa of the destroying insect. *Say.*

(3) Descent or derivation, as of offspring from parents; the actual result of generation or procreation. As a fact, this evolution is not open to question. As a doctrine or theory of generation, it is susceptible of different interpretations. In one view, the germ actually preëxists in one or the other parent, and is simply unfolded or expanded, but not actually formed, in the act of procreation. According to the other view each parent furnishes materials for or the substance of the germ, whose evolution results from the union of such elements, or from the interaction between the developing egg and its environment. (4) The fact or the doctrine of the derivation or descent, with modification, of all existing species, genera, orders, classes, etc., of animals and plants, from a few simple forms of life, if not from one; the doctrine of derivation; evolutionism. (See *Darwinism*.) In this sense, *evolution* is opposed to *creationism*, or the view that all living things have been created at some time substantially as they now exist. Modern evolutionary theories, however, are less concerned with the problem of the origination of life than with questions of the ways and means by which living organisms have assumed their actual characters or forms. Phylogenetic evolution insists upon the direct derivation of all forms of life from other antecedent forms, in no other way than as, in ontogeny, offspring are derived from parents, and consequently grades all actual affinities according to propinquity or remoteness of genetic succession. It presumes that, as a rule, such derivation or descent, with modification, is from the more simple to the more complex forms, from low to high in organization, and from the more generalized to the more specialized in structure and function; but it also recognizes retrograde development, degeneration or degradation. The doctrine is now accepted by most biologists as a conception which most nearly coincides with the ascertained facts in the case, and which best explains observed facts, though it is held with many shades of individual opinion in this or that particular. See *natural selection*, under *selection*.

Evolution, or development, is, in fact, at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it. *Huxley*, Evolution in Biology.

(*b*) In general, the passage from unorganized simplicity to organized complexity (that is, to a nicer and more elaborate arrangement for reaching definite ends), this process being regarded as of the nature of a growth. Thus, the development of planetary bodies from nebular or gaseous matter, and the history of the development of an individual plant or animal, or of society, are examples of evolution.

Evolution is an integration of matter and concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation.
H. Spencer, First Principles, § 145.

The hypothesis of *evolution* supposes that in all this vast progression there would be no breach of continuity, no point at which we could say, "This is a natural process," and, "This is not a natural process"; but that the whole might be compared to that wonderful process of development which may be seen going on every day under our eyes, in virtue of which there arises, out of the semi-fluid, comparatively homogeneous substance which we call an egg, the complicated organization of one of the higher animals. That, in a few words, is what is meant by the hypothesis of *evolution*. *Huxley*, Amer. Addresses, p. 10.

(*c*) Continuous succession; serial development.

3. In *math.*: (*a*) In *geom.*, the unfolding or opening of a curve, and making it describe an evolvent. The equable evolution of the periphery of a circle or other curve is such a gradual approach of the circumference to straightness that its parts do not concur and equally evolve or unbend, so that the same line becomes successively a smaller arc of a reciprocally greater circle, till at last they change into a straight line. (*b*) The extraction of roots from powers: the reverse of *involution* (which see).—**4.** A turning or shifting movement; a passing back and forth; change and interchange of position, especially for the working out of a purpose or a plan; specifically, the movement of troops or ships of war in wheeling, countermarching, manœuvering, etc., for disposition in order of battle or in line on parade: generally in the plural, to express the whole series of movements.

These *evolutions* are doublings of ranks or files, countermarches, and wheelings. *Harris.*

ex[5] (eks), *prep.* [L. *ex*, prep., out of, from. See *ex-*.] A Latin preposition, meaning 'out,' 'out of.' It is used in English only in certain commercial formulas, as—(*a*) "20 chests tea *ex* Sea-King," where *ex* means taken out of or delivered from the vessel named; (*b*) "*ex* div."—that is, without dividend (meaning that the dividend on the stocks sold has been declared and is reserved by the seller); and in some Latin phrases: *ex mero motu*, of his own accord; *ex necessitate rei*, from the necessity of the case; *ex officio*, by virtue of his office; *ex parte*, on one side only; *ex post facto* (which see); *ex vi termini*, from the very meaning of the term.

ex-. [ME. *ex-*, *es-*, *as-*, OF. *ex-*, *es-*, F. *ex-*, *é-* = Sp. Pg. *ex-*, *es-* = It. *ex-*, *es-*, *s-*, etc., < L. *ex-*, prefix, < *ex*, prep. (so always before vowels, before consonants either *ex* or *e*, more frequently *ex*), of place, out of, from, away from, beyond; of time, after, from, since; of cause, from, through, by reason of, etc.; in comp., out, forth, out of, throughout, to the end, hence thoroughly, utterly, etc. (equiv. to *out* or *up* used intensively); in LL. *ex-* is also used, as now in E., to signify 'out of office': *exconsularis*, an ex-consul, etc. As a prefix *ex-* stands before vowels and *h* and before *c*, *p*, *q*, *t*, and before *s*, the *s* being in this case optionally dropped; e. g., *exsistere* (**ecs-sistere*) or *existere*, exist, one *s*, orthographically the second, phonetically the first (*existere* being pronounced *ec-sistere*), being omitted; before *f ex-* becomes *ef-*, sometimes *ec-*, rarely remaining unchanged; elsewhere *e-*. L. *ex* = Gr. *ἐξ* (before a vowel), *ἐκ* (before a consonant), out of, from (in comp. *ἐξ-*, *ἐκ-*), = Russ. *iz'*, out. In ME., OF., Sp., etc., *ex-* may appear as *es-*; ME. also *as-*, and sometimes by confusion or interchange *en-* (cf. *example*, ME. *ex-*, *es-*, *as-*, and *en-sample*). In most cases of this kind the L. form *ex-* has been restored. See further under *es-*.] A prefix of Latin, and in some cases of Greek origin, meaning primarily 'out,' 'out of.' In English words it preserves or reproduces its particular uses in the language of its origin. (See etymology.) Thus, in *exclude*, *exhale*, etc., it signifies 'out,' 'out of'; in *exscind*, 'off'; in *exceed*, *excel*, etc., 'beyond.' It is often (especially in the reduced form *e-*) simply privative, as in *exstipulate*, *eplicate*. In some words it is intensive merely, in others it has no particular force. Prefixed to names implying office, *ex-* signifies that the person has held but is now 'out of' that office: as, *ex*-president, *ex*-minister, *ex*-senator.

=**Syn. 1.** *Examination*, *Inquiry*, *Investigation*, *Inquisition*, *Scrutiny*, *Search*, *Research*, *Inspection*; overhauling, probing, canvassing. *Examination* is the general word; where it is applied to any work of severity, thoroughness, etc., the fact is expressed by a strong adjective or other modifier: as, a superficial, thorough, brief, protracted, or searching *examination* into facts, into a question, of a candidate, or of a locality or premises. *Inquiry* is made by asking questions, but figuratively by study or *investigation*: as, an *inquiry* into the value of circumstantial evidence. An *investigation* is an *examination* long enough, systematic enough, and minute enough to be thorough. An *inquisition* is something still more thorough and searching than an *investigation*, implying vigor with severity; in modern times it generally implies a somewhat hostile spirit, or that from which the person concerned would shrink. *Scrutiny* is primarily a close examination with the eye: as, the *scrutiny* of one's features, of a manuscript, of a field of vision; but it is also a critical examination by the mind: as, the careful *scrutiny* of evidence. *Search* is the effort to find primarily that which may be seen, but secondarily that which may be apprehended by the mind: as, the *search* for a lost coin, or for a clue to a mystery. *Research* is *search* only of the second class above, and in out-of-the-way fields of knowledge: as, archæological *research*. *Inspection*, literally a looking into, is sometimes a rather general word and equivalent to *examination*; but more often it implies an official *examination*: as, an *inspection* of work done under contract; the sanitary *inspection* of a jail, or of a ship just come into port.

5. In *zoöl.*, a prepared specimen.—6. In *math.*, an arithmetical or algebraic problem, illustrating a rule or method, to be worked out by a student: as, an *example* in addition; an *example* in quadratics.—**Argument from example**, the same as *reasoning from analogy*, which latter expression has superseded the former, except in translations from Aristotle and other ancient writers on logic.

=**Syn.** *Example, Pattern, Model, Precedent, Ideal, Instance;* archetype, prototype; exemplification. *Example* is the most general of these words; it is the only one of them that admits application to that which is to be avoided. An *example* is something to guide the understanding, so that one may decide what to do and what not to do. *Pattern* and *model* express that which is to be closely followed or copied; they primarily refer to physical shape: as, an artist's *model;* but also freely to the shaping of conduct and character: as, a *pattern* of sobriety; a *model* of virtue. Perhaps *model* suggests the more complete *example*, but the difference between the two words in this respect is small. A *precedent* is an *example* set in the past, as a legal decision which may be pleaded in law as the basis of a further decision, and in private affairs a thing once done or allowed, and so pleaded as a reason or an excuse for more of the same sort: as, a *precedent* for indulgence. An *ideal* is a model of perfection, primarily imaginary, but by hyperbole sometimes real. An *example* is generally a representative person or thing, but the word is sometimes used instead of *instance* with reference to a representative act or course of conduct: as, to prove a rule by *examples;* to prove a man's fidelity or treachery by *instances* or *examples*.

Princes that would their people should do well
Must at themselves begin, as at the head;
For men by their *example* pattern out
Their imitations and regard of laws.

We have followed *precedents* as long as they could guide us; now we must make *precedents* for the ages which are to succeed us. *O. W. Holmes*, Essays, p. 115.

Every man has at times in his mind the *ideal* of what he should be but is not.
Theodore Parker, Crit. and Misc. Writings, i.

All that can be expected in an *ideal* is that it should be perfect in its own kind, and should exhibit the type most needed in its age, and most widely useful to mankind.
Lecky, Europ. Morals, I. 163.

5. In *law*: (*a*) In conveyancing, a clause in a deed taking out something from that which appears to be granted by the preceding part of the deed, by which means it is severed from the estate granted, and does not pass. (*b*) The thing or part of the premises thus withheld. (*c*) In equity practice, an allegation, required to be in writing, pointing out the particular matter in an adversary's pleading which is objected to as insufficient or improper. (*d*) In common-law practice, the specific statement, required to be in writing or noted on the record, of an objection taken by a party to a ruling or decision by the court or a referee, the object being to show to the higher court to which the matter may be appealed that the ruling was adhered to and carried into effect against explicit objection, or to inform the adverse party of the precise point of the objection, or both. See *bill of exceptions*, below. In the Roman law *exceptio* was a plea similar to our confession and avoidance. Thus, such a plea would be a claim to offset a debt. In a narrower sense, however, it was restricted to the plea that an action competent in law should be excluded on the ground of equity. Such a plea was held to be dangerous, because, the facts alleged by way of exception being once disproved, the claim of the plaintiff was held to be proved as good in law by the pleading of the *exceptio*. Hence, probably, the maxim "The *exception* proves the rule" (Latin *exceptio probat regulam*, 11 Coke 41; French *l'exception prouve la règle*), which is certainly of legal origin. The words "in cases not excepted" (Latin *in casibus non exceptis*) are, however, commonly added; and the maxim is taken to mean that an express exception implies that the general rule is the opposite of the case mentioned.

As *exception* corroborates the application of law in cases not excepted, so enumeration invalidates it in cases not enumerated. *Bacon*, De Augmentis (ed. Spedding), VIII. iii.

If it be well weighed, that certificate makes against them; for as *exceptio firmat legem in casibus non exceptis*, so the excepting of that shire by itself doth fortify that the rest of the shires were included in the very point of difference. *Bacon*, Jurisdiction of the Marches.

It acquired, in time, the jurisdiction of ordinary superior common-law courts, by allowing any suitor who desired to bring his complaint before it to allege that by the defendant's injustice he was prevented from discharging his debts to the king's revenues, which allegation the court did not allow to be denied. The court also had, up to 1841, an equity side. In 1873 it became the Exchequer Division of the High Court of Justice and was merged in the Queen's (King's) Bench Division by an order in council of Dec. 16, 1880.

The *Exchequer* of the Norman kings was the court in which the whole financial business of the country was transacted; and as the whole administration of justice, and even the military organisation, was dependent upon the fiscal officers, the whole framework of society may be said to have passed annually under its review. It derived its name from the chequered cloth which covered the table at which the accounts were taken, a name which suggested to the spectator the idea of a game at chess between the receiver and the payer, the treasurer and the sheriff. As this name never occurs before the reign of Henry I., and as the tradition of the court preserved the remembrance of a time when the business which took place in it was transacted 'ad taleas,' 'at the tallies,' it seems certain that the date of complete organisation should be referred to this period. *Stubbs*, Const. Hist., § 126.

It was supplanted by the Court of Appeal in 1875.—**Exchequer bill,** a negotiable interest-bearing bill of credit, issued under the authority of acts of Parliament, by the Exchequer Department of the British government, for the purpose of raising money for temporary purposes, or to meet some sudden emergency. Exchequer bills run for five years; the interest is payable per attached coupons half-yearly, and is fixed every year, but can never exceed 5½ per cent. per annum. They are issued for sums of £100 each, or some multiple of £100. They were first issued in 1696, and form a large part of the unfunded public debt of Great Britain.—**Exchequer bonds,** bonds issued in Great Britain by the Commissioners of the Treasury, under authority of the same act as exchequer bills, and for the same purpose, which run for a definite period of time, not exceeding six years, the interest payable on the same, which can never exceed 5½ per cent. per annum, being fixed at the time of issue.

Excommunication, often with very severe consequences, was practised in various ways among the ancient Greeks, Romans, and Jews, and is still in use among the Mohammedans. In the early Christian church it consisted simply in the exclusion of an offending member from fellowship by some formal action, and this is the practice in most modern Protestant churches. As the power of the church increased, excommunication became more complicated in method and severe in effect. As now practised in the Roman Catholic and related churches, it may be either partial or total, temporary or perpetual. By the partial, called the *minor* or *lesser excommunication*, the offender is suspended from the use of the sacraments, and perhaps from the privileges of church worship; by the total, or the *major* or *greater excommunication*, he is also cut off from the society and fellowship of the church, and it may be from all intercourse with its members. Further distinctions as to the sentence and its effects are made in the Roman Catholic Church. See *anathema, discipline.*

It is indeed an opinion strangely prevailing amongst men, that houses, mountains, rivers, and in a word all sensible objects, have an *existence* natural or real, distinct from their being perceived by the understanding.
Bp. Berkeley.

Hence—**2.** Life; vital or sentient being; state of life.

Is death to be feared that will convey thee to so happy an *existence?* *Addison*, Vision of Mirza.

The soul, secured in her *existence*, smiles
At the drawn dagger, and defies its point.

Darwin, Origin of Species, p. 62.

2. Expressing or stating the fact of existence.

Convention does not allow us to say "It executes," as we say "It blows" or "It thunders," because (if for no other reason) the group of phenomena is not one of familiar immemorial occurrence. But we can just as conveniently adopt the *existential* form, "There was an execution," as the predicative form, "A man was hanged"; and as a matter of fact, one form would be as readily employed as the other. *J. 2. The state of being expanded; enlargement; distention; dilatation; increase of extent, size, bulk, amount, etc. In the case of the expansion of solids by heat, account is taken of the increase in length or linear expansion, in surface (superficial expansion), and in volume (cubical expansion). The increment in length of the unit for a change of 1° in temperature, or the rate of increase of the unit with the temperature, is called the coefficient of linear expansion; and the coefficients of superficial and cubical expansion, which are respectively two and three times the linear coefficient, are similarly defined. In the case of liquids and gases the expansion in volume is alone considered. The real or absolute expansion of a liquid is the actual increase in volume, while the apparent expansion is that which is observed when a liquid contained in a vessel is heated, and which is less than the real expansion, because of the simultaneous expansion of the vessel itself. It is found that the coefficient of expansion is nearly the same for different gases, and sensibly so for the so-called permanent gases, as hydrogen, oxygen, etc. This coefficient is equal to .003667 for 1° C., or about $\frac{1}{273}$—that is, at 273° C. the volume of a gas expanding under constant pressure is double its volume at 0°; and at —273° C. the volume would be theoretically zero. This last temperature is called the absolute zero.

Spread not into boundless *expansions* either of designs or desires. *Sir T. Browne*, Christ. Mor., i. 19.

Some remarkable examples of *expansion* are furnished by the influence of sunshine on the Britannia Tubular Bridge. *Ure*, Dict., II. 319.

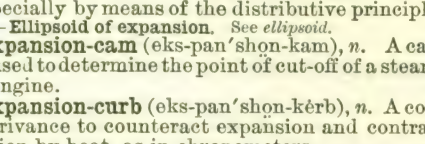
Venus, all-bounteous queen, whose genial pow'r
Diffuses beauty, in unbounded store,
Through seas and fertile plains, and all that lies
Beneath the starr'd *expansion* of the skies.
Beattie, Lucretius, i.



Distance or space, in its simple abstract conception, to avoid confusion, I call *expansion*, to distinguish it from extension, which by some is used to express this distance only as it is in the solid parts of matter, and so includes or at least intimates the idea of body. . . . I prefer also the word *expansion* to space, because space is often applied to distance of fleeting successive parts, as well as to those which are permanent. *Locke*, Human Understanding, II. xv. 1.

6. In *math.*, the development at length of an expression indicated in a contracted form, especially by means of the distributive principle. —**Ellipsoid of expansion.** See *ellipsoid.*

expansion-engine (eks-pan′shọn-en″jin), *n.* A steam-engine in which the supply of steam from the boiler is cut off previous to the completion of the stroke, the expansive power of the steam admitted being sufficient to complete the stroke.—**Triple expansion-engine,** a steam-engine in which steam is expanded in three steps or stages, the exhaust from the first cylinder driving the piston of the second, and so on.

expansion-gear (eks-pan′shọn-gēr), *n.* In a steam-engine, all those parts of the mechanism that control the admission of the live steam from the boiler to the cylinder. In early forms the distribution of steam to the two ends of the cylinder and out from them took place throughout the entire stroke, and variable expansion on the driving stroke was secured by special extra mechanisms. In modern engines variable expansion is secured by the distribution-gear. Variable expansion may be secured, as in the locomotive, by changing the point of cut-off at will while the engine is at work; it may be fixed or secured at some pre-determined point of the stroke; or it may be automatic or self-varying. A very usual apparatus includes an expansion-valve moving on the slide-valve and controlled by an eccentric on the shaft and by the governor. See *cut-off* and *link-motion.*

★**expansion-valve** (eks-pan′shọn-valv), *n.* In a steam-engine, a valve which shuts off the steam in its passage to the slide-valves when the piston has traveled a certain distance in the cylinder, leaving the remaining part of the stroke to be performed by the expansion of the steam. See *expansion-gear.*

Ex-parte hearings, evidence, etc., are often resorted to for temporary relief, or for convenience and expedition, and are not supposed to affect the substantial rights of the absent party. Councils are of two kinds—mutual and ex-parte. A mutual council is one in the calling of which all parties to the difficulty or perplexity concerning which relief is sought unite. An *ex-parte council* is one which is called by one of those parties, after every proper effort to induce all interested to call a mutual council has failed. *H. M. The ill-repute which attaches to considerations of *expediency*, so far as it is well founded, is chiefly due to the fact that, when the question of conduct at issue is one which the person debating it has a private interest in deciding one way or the other — when he himself will gain pleasure or avoid pain by either decision — the admission of *expediency* as the ground of decision is apt to give him an excuse for deciding in his own favour.
T. H. Green, Prolegomena to Ethics, § 330.

J. H. Newman, Parochial Sermons, i. 312.

=Syn. *Explain, Expound, Interpret, Elucidate.* *Explain* is the most general of these words, and means to make plain, clear, and intelligible. *Expound* is used of elaborate, formal, or methodical explanation: as, to *expound* a text, the law, the philosophy of Aristotle. To *interpret* is to *explain*, as if from a foreign language, to make clear what before was dark, and generally by following the original closely, as word by word and line by line: as, to *interpret* Hegel, Swedenborg, Emerson. To *elucidate* is to bring or work out into the light that which before was dark, usually by means of illustration; the word generally implies, like *expound*, a somewhat protracted or elaborate process. See *translate.*

The quarrel is a very pretty quarrel as it stands; we should only spoil it by trying to *explain* it.
Sheridan, The Rivals, iv. 3.

The aim in *expounding* a great poem should be, not to discover an endless variety of meanings often contradictory, but whatever it has of great and perennial significance. *Lowell*, Among my Books, 2d ser., p. 44.

One speaks the glory of the British Queen,
And one describes a charming Indian screen;
A third *interprets* motions, looks, and eyes.
Pope, R. of the L., iii. 2.

The scheme of the Gospel is not only of the most transcendent use, as it confirms, *elucidates*, and enforces the moral law, but of the most absolute necessity.

Sir T. Browne, Vulg. Err., v. 21.

explainer (eks-plā′nėr), *n.* One who explains; an expositor; an interpreter.

Unless he can show his authority to be the sole *explainer* of fundamentals, he will in vain make such a pudder about his fundamentals. Another *explainer*, of as good authority as he, will set up others against them.
Locke, Vind. of Christianity.

explait†, *n.* [ME. *explait, esplait, expleit, espleit*, < OF. *esplait, espleit, expleit*, an action, exploit, etc.: see *exploit, n.*, of which *explait* is an earlier form.] **1.** Achievement.—**2.** Advantage; furtherance; promotion.

For *explait* of their spede, thai spekyn in fere
To chese hom a cheftayn to be chefe of them all.
Destruction of Troy (E. E. T. S.), l. 3661.

(*a*) The act or process of making plain or clear the nature, meaning, or significance of something; the act of rendering intelligible what was before obscure, as by analysis or description; elucidation; interpretation: as, the *explanation* of a passage in Scripture, or of a contract or treaty.

Explanation, then, is analysis, real or ideal, sensible or extra-sensible. It takes the object, or the feeling, to pieces; and is a perfect analysis when the pieces that are obtained can be put together again, and form the original whole. *G. H. Lewes*, Probs. of Life and Mind, II. ii. § 3.

(*b*) The process of showing by reasoning or investigation the causal or logical antecedents or conditions of some thing or event which is to be accounted for; specifically, the making clear by reasoning how certain observed or admitted facts may have been brought about by the action of known principles, if a certain supposition is allowed; the unification of a confused mass of facts, by means of a single known or supposed fact from which they would all necessarily or probably result.

The word *explanation* occurs so continually, and holds so important a place in philosophy, that a little time spent in fixing the meaning of it will be profitably employed. An individual fact is said to be explained, by pointing out its cause, that is, by stating the law or laws of causation, of which its production is an instance. Thus, a conflagration is explained, when it is proved to have arisen from a spark falling into the midst of a heap of combustibles. *J. S. Mill*, Logic, III. xii. § 1.

What is called the *explanation* of a phenomenon by the discovery of its cause, is simply the completion of its description by the disclosure of some intermediate details which had escaped observation.
G. H. Lewes, Aristotle, p. 76.

We suppose the cryptograph to be an English cipher, because, as we say, this explains the observed phenomena that there are about two dozen characters, that one occurs much more frequently than the rest, especially at the ends of words, etc. The *explanation* is: Simple English ciphers have certain peculiarities; this is a simple English cipher: hence, this necessarily has these peculiarities. This *explanation* is present to the mind of the reasoner, too; so much so, that we commonly say that the hypothesis is adopted for the sake of the *explanation*. *C. S. Peirce.*

2. That which is adduced as explaining or seeming to explain; specifically, a meaning or interpretation assigned; the sense given by an expounder or interpreter.

The ill effects that were like to follow on those different *explanations* [of the Trinity] made the bishops move the king to set out injunctions requiring them to see to the repressing of error and heresy with all possible zeal.
Bp. Burnet, Hist. Own Times, an. 1698.

In *rhet.* and *gram.*, a word or syllable which is not necessary to the sense or construction, or to an adequate description of a thing, but which is added for rhetorical, rhythmical, or metrical reasons, or which, being once necessary or significant, has lost notional force. Expletives of the former kind are usually trite adjectives, added, as in feeble prose or verse, for the mere sound or to fill out a line, or else irrelevant words or terms used for factitious emphasis, as in profane swearing. Expletives of the latter kind are usually particles like the introductory *there*, used without local reference, and the auxiliary *do*, used as in the first line of the quotation from Pope.

Expletives their feeble aid do join,
And ten low words oft creep in one dull line.
Pope, Essay on Criticism, l. 346.

Circuitous phrases and needless *expletives* distract the attention and diminish the strength of the impression produced. *H. Spencer*, Style.

Hence comes the common *explicit* written at the end of a work; and from the analogy of *incipit liber* in titles, the word was afterward taken for a verb, and appears in such phrases as *explicit liber*, *explicit*, *expliceat*, &c.

3. In *alg.*, a symbol placed above and at the right of another symbol (the base), to denote that the latter is to be raised to the power indicated by the former. Thus, $a^2 = aa$, 2 being the exponent. The process symbolized by a negative exponent is the same as taking the reciprocal of the quantity with the positive exponent. Thus, $a^{-2} = \frac{1}{a^2}$. A fractional exponent, the numerator of the fraction being unity, indicates the operation of taking that root of the base which is indicated by the denominator of the exponent: thus, $x^{\frac{1}{2}} = \sqrt{x}$. Exponents are usually understood to follow the associative law $(a^b)^c = a^{(bc)}$, and the distributive law $a^{b+c} = a^b a^c$. But in quaternions and multiple algebra the latter holds only in a modified form. In Hamilton's notation of quaternions, $(a^b)^c = a^{(cb)}$. Exponents were introduced into the notation of algebra by Descartes.

extended (eks-ten'ded), *p. a.* **1.** Having extent or extension; occupying space; dimensional; spatial.

We perceive it [body] as something different from our perception, and we perceive it as having something not in our perception; we perceive it, in short, as *extended*. *McCosh*, Berkeley, p. 67.

As soon as definite perception begins, the body as an *extended* thing is distinguished from other bodies, and such organic sensations as can be localized at all are localized within it. *J. Ward*, Encyc. Brit., XX. 84.

2. In *her.*, same as *displayed*.

Certain moleculæ seminales must be supposed to make up that defect, and to keep the world and its integrals from an infinitude and *extendlessness* of excursions every moment into new figures and animals. *Sir M. Hale*, Orig. of Mankind, p. 10.

extendure† (eks-ten'dūr), *n.* [< *extend* + *-ure*. Cf. *extensure*.] Extent.

Abridg'd the large *extendure* of your grounds.
Middleton, Anything for a Quiet Life, v. 2.

extense (eks-tens'), *a.* [= OF. *extense, estense*, < L. *extensus*, pp. of *extendere*, extend: see *extend*.] Extended. [Rare.]

extensibility (eks-ten-si-bil'i-ti), *n.* [= F. *extensibilité* = Sp. *extensibilidad* = Pg. *extensibilidade*; as *extensible* + *-ity*.] The quality of being extensible: as, the *extensibility* of a fiber or of a plate of metal.

The *extensibility*, and consequently the divisibleness, of gold is probably far more wonderful. *Boyle*, Subtilty of Effluviums, ii.

The articulation of the lower jaw loses in strength, while it gains in *extensibility*, as is seen in the development of the line of the eels among fishes. *E. D. Cope*, Origin of the Fittest, p. 335.

extensible (eks-ten'si-bl), *a.* [< F. *extensible* = Sp. *extensible* = Pg. *extensivel*, < L. as if **extensibilis*, < *extendere*, pp. *extentus*, later *extensus*, extend: see *extend, extense*.] **1.** Capable of being extended; admitting of being stretched in length or breadth; susceptible of enlargement or expansion.

The lungs act like a sphygmoscope: they are dilated by internal pressure until their resistance to further dilatation is equal to the dilating force. The less *extensible* they are or become, the sooner will this limit be reached. *A. Daniell*, Prin. of Physics, p. 304.

2. In *zoöl.*, capable of being thrust out; extensile; protrusile.

If we view the articulated moveable spines and the *extensile* and prehensile tubes in the light of primitive forms of locomotive extremities, we shall see in their great numbers and irrelative repetition an illustration of the same law. *Owen*, Anat., x.

★**extension** (eks-ten'shọn), *n.* [= OF. *extension, estension*, F. *extension* = Sp. *extensión* = Pg. *extensão* = It. *estensione*, < L. *extensio(n-)*, a stretching out, extension, < *extendere*, pp. *extentus, extensus*, stretch out: see *extend*.] **1.** The act of extending; a stretching or expanding. Specifically—(*a*) In *surg.*, the act of pulling the broken part of a limb in a direction from the trunk, in order to bring the ends of the bone into their natural situation. (*b*) In *anat.*: (1) The protrusion of a part away from another part: as, *extension* of the tongue. (2) The straightening of a part, as a limb. (3) The action or function of any extensor muscle, whatever its effect. The continued action of a muscle which straightens a limb may carry a part not only to but beyond a right line, or, if the successive joints of a part be already straight, may bend them. Thus, when the hand is bent back at the wrist, or the end of the thumb is recurved, or the whole trunk of the body is thrown back from the hips, the action or movement is literally *flexion*; but it results from the action of muscles which in most positions of the parts tend to straighten or extend them, and is termed *extension*. See *abduction, adduction, flection*.

2. The state of being extended; enlargement; expansion; extent.

We entered a large and thick wood of palm-trees, whose greatest *extension* seemed to be south by east. *Bruce*, Source of the Nile, I. 52.

3. In *physics* and *metaph.*, continuous quantity of space; also, that property of a body by which it occupies a portion of space.

By this idea of solidity is the *extension* of body distinguished from the *extension* of space: the *extension* of body being nothing but the cohesion or continuity of solid, separable, movable parts; and the *extension* of space the continuity of unsolid, inseparable, and immovable parts. . . . This space, considered barely in length between any two beings, without considering anything else between them, is called distance; if considered in length, breadth, and thickness, I think it may be called capacity. The term *extension* is usually applied to it in what manner soever considered. . . . There are some who would persuade us that body and *extension* are the same thing. . . . If therefore they mean by body and *extension* the same that other people do—viz., by body something that is solid and extended, whose parts are separable and movable different ways, and by *extension* only the space that lies between the extremities of those solid coherent parts, and which is possessed by them—they confound very different ideas with one another. . . . If any one ask me what this space I speak of is, I will tell him when he tells me what his *extension* is. For to say, as is usually done, that *extension* is to have partes extra partes, is to say only that *extension* is *extension*: for what am I the better informed in the nature of *extension* when I am told that *extension* is to have parts that are extended exterior to parts that are extended? . . . To avoid confusion in discourses concerning this matter, it were possibly to be wished that the name *extension* were applied only to matter or the distance of the extremities of particular bodies. *Locke*, Human Understanding, II. iv.–xiii.

Doubtless, *Extension* is the fundamental aspect of the objective world as it offers itself to our apprehension. In our everyday view of things, which psychology has to render account of, space has the same appearance of external reality as the body that fills it; and *extension* is the one attribute that is common alike to body and to space. *G. C. Robertson*, Mind, XIII. 420.

4. The character of having continuous quantity of any kind, as length of time, weight, etc.

Rate not th' *extension* of the human mind
By the plebeian standard of mankind,
But by the size of those gigantic few
Whom Greece and Rome still offer to our view.
Jenyns, Immortal. of Soul.

5. In *logic*, the totality of subjects of which a logical term is predicable. Logical extension is generally understood to consist of individual objects, but some logicians make it consist of species. The extension is also called the *supposita*, the *subjective parts*, the *external quantity*, the *scope*, the *denotation*, and the *breadth*. (See *breadth*.) It is contrasted with *comprehension* and *intention*. Many logicians say that the greater the extension of a term, the less its comprehension—that is, the more subjects it can be predicated of, the fewer the predicates that can be asserted of it universally. But this statement takes no account of increase of knowledge.

6. A grant of further time in which to do something which has been set down for a particular day. Specifically—(*a*) In *legal proceedings*, a postponement, by agreement of the parties or act of the court, of the time set for service of papers or for other acts. (*b*) In *com.*, a written engagement on the part of a creditor, allowing a debtor further time to pay a debt; more especially, an agreement made between an embarrassed debtor and his creditors, by which the latter agree to wait a fixed time after their claims are due before demanding payment, in order to enable the former to meet his obligations. The agreement is often effected by issuing notes that mature at various times.

7. That by which something is extended or enlarged; particularly (in the United States), an addition to a house, usually at the rear, and not so high as the main building: as, a dining-room *extension*. The term applies whether the extension is part of the original building or is a subsequent addition.—**Difform extension,** the extension of a heterogeneous body, such as a pudding-stone.—**Extension of title,** in *law*, in parts of the United States acquired from Mexico, the certificate of location usually issued by a local commissioner appointed for the purpose, to designate the particular land on which an original grant is to take effect. It is a title of possession, and necessary to perfect the original grant, which does not attach to any specified land. By its issue the grant is said to be extended upon the land designated.—**Uniform extension,** the extension of a homogeneous body, such as a piece of gold.

extensional (eks-ten'shọn-al), *a.* [< *extension* + *-al*.] Pertaining to or having extension or extent; existing in space.

You run upon these *extensional* phantasms, which I look upon as contemptuously as upon the quick wrigglings up and down of pismires. *Dr. H. More*, Divine Dialogues.

extension-pedal (eks-ten'shọn-ped′al), *n.* In the pianoforte, a pedal for raising the dampers

and thus prolonging the tone; the damper-pedal, or loud pedal.

extension-table (eks-ten′shọn-tā″bl), *n.* A table the frame of which is capable of being drawn out in length for the insertion of additional leaves on the top. Such tables are especially used for dining-tables. There are several different mechanical contrivances used in their manufacture.

extensity (eks-ten′si-ti), *n.* [< L. *extensus*, pp. of *extendere*, extend (see *extense*), + *-ity;* after *intensity.*] That kind or element of sensation from which the perception of extension is developed. It is, according to some psychologists, an element in most of our sensations, and is more or less in amount, according to the greater or smaller number of nerve-terminals excited. Other psychologists deny or doubt the existence of any such special feeling.

In a given sensation, more particularly in our organic sensations, we can distinguish three variations: viz., variations of quality, of intensity, and of what Dr. Bain has called massiveness, or, as we will say, *extensity.*
J. Ward, Encyc. Brit., XX. 46.

Extensity is Mr. Ward's name . . . for this primitive quality of sensation, out of which our several perceptions of extension grow. *W. James*, Mind, XII. 183, note.

★**extensive** (eks-ten′siv), *a.* [= F. *extensif* = Pr. *extensiu* = Sp. Pg. *extensivo* = It. *estensivo, stensivo,* < LL. *extensivus,* < L. *extensus,* pp. of *extendere*, extend: see *extend.*] **1†.** That may be extended or spread out; extensible.

Silver-beaters choose the finest coin, as that which is most *extensive* under the hammer. *Boyle.*

2. Having considerable extent; wide; large; embracing a wide area or a great number of objects; diffusive: as, an *extensive* farm; an *extensive* sphere of operations; *extensive* benevolence.

Op'ning the map of God's *extensive* plan,
We find a little isle, this life of man.
Cowper, Retirement, l. 147.

3. Pertaining to or characterized by extension in space or in any quantity; having extent or extension.

We do not first experience a succession of touches or of retinal excitations by means of movements, and then, when these impressions are simultaneously presented, regard them as *extensive* because they are associated with or symbolize the original series of movements; but, before and apart from movement altogether, we experience that massiveness or extensity of impressions in which movements enable us to find positions, and also to measure. *J. Ward*, Encyc. Brit., XX. 53.

All our sensations are positively and inexplicably *extensive* wholes. *W. James*, Mind, XII. 536.

4. Pertaining to logical extension.—**Extensive completeness** of a cognition, the perfection of extensive distinctness; thoroughness.—**Extensive distinctness,** the division of the logical extension of a term, in the apprehension of it, into many coördinated marks. Thus, a man who knows all the genera of a zoölogical or botanical family may increase the *extensive distinctness* of his knowledge by learning all the species.—**Extensive energy.** See *energy.*—**Extensive proposition,** in the logic of Sir William Hamilton and his followers, a proposition whose predicate is regarded as a whole under which the subject is contained.—**Extensive quantity.** (*a*) Continuous quantity of space and time.

I call an *extensive quantity* that in which the representation of the whole is rendered possible by the representation of its parts, and therefore necessarily preceded by it. I cannot represent to myself a line, however small it may be, without drawing it in thought.
Kant, Critique of Pure Reason, tr. by Müller.

(*b*) Logical extension.

The external or *extensive quantity* of a concept is determined by the greater or smaller number of classified concepts or realities contained under it. *Sir W. Hamilton.*

Extensive sublimity, the possession of so great a multitude of parts that the imagination sinks under the attempt to represent the whole by an image, thus giving rise to a peculiar emotion.=**Syn. 2.** Broad, comprehensive, capacious, extended, spacious, roomy, ample.

extensively (eks-ten′siv-li), *adv.* **1.** With regard to extension or extent.

By more complex efforts that are found to procure tactile impressions (continuous or discrete, as the case may be)—efforts not interpretable as movements till they have done their part in the work of psychological construction—we distinguish this and that *extensively* within such body, and the body as a whole in relation to our own bodily frame. *G. C. Robertson*, Mind, XIII. 423.

2. In an extensive manner; widely; largely; to a great extent: as, a story *extensively* circulated.

'Tis impossible for any to pass a right judgement concerning them, without entering into most of these circumstances, and surveying them *extensively.*
Watts, Improvement of Mind.

Like boys who are throwing the sun's rays into the eyes of a mob by means of a mirror, you must shift your lights and vibrate your reflexions at every possible angle, if you would agitate the popular mind *extensively.*
De Quincey, Style, i.

extensiveness (eks-ten′siv-nes), *n.* **1.** The quality of being extensive.

3. Same as *extensity.* [Rare.]

Extensiveness, being an entirely peculiar kind of feeling, indescribable except in terms of itself, and inseparable in actual experience from some sensational quality which it must accompany, can itself receive no other name than that of sensational element. *W. James*, Mind, XII. 2.

★**extensometer** (eks-ten-som′e-tėr), *n.* [Irreg. < L. *extensus*, pp. of *extendere*, extend, + *metrum*, a measure.] An apparatus for measuring minute degrees of expansion or contraction in metal bars under the influence of temperature or under strain. See *expansion.*

Extents have been used in some of the United States, by which a judgment creditor could have the lands of the debtor valued, and transferred to himself, absolutely or for a term of years, instead of having them sold in satisfaction of the debt.

The corresponding L. superl. is *extremus:* see *extreme*.] **I.** *a.* 1. Situated or being outside; pertaining to or connected with that which is outside; outward; outlying; external: as, the *exterior* relations or possessions of a country; an *exterior* boundary or line of fortification. In mathematics applied to a position with reference to a surface in space such that from that position it would be possible to proceed by a continuous motion to infinity without crossing the surface. In like manner, on a surface a position is exterior to a contour if from that position it would be possible to move to the limit of the surface, or to infinity, without crossing the contour. Also, if a space, a surface, or a line be divided into three parts in such a manner that from the first it would not be possible to pass to the third without traversing the second, the first and third are said to be exterior to the second. Upon a closed surface, or curve, the term *exterior* can have only a modified meaning; the larger part is generally regarded as the exterior. When two lines are crossed by a third line eight angles are formed, and of these those that are outside of the space between the first two are termed *exterior*, although if another pair of the three lines is considered as the first pair other angles will be exterior.

The extinction-directions in a section of a transparent doubly refracting substance are the principal planes of light-vibration; for if the section is placed between the crossed nicols, it remains dark only when these directions coincide with the vibration-planes of the nicols. In some words, as *alley*, *money*, etc., it represents an earlier diphthong; in others the *e* is unhistorical, the termination being a mere orthographic variant of *-y* or *-ie*, as in *honey*, *donkey*, *monkey*, *whiskey*, etc., being referred, as a suffix, to the simple *-y* when attached to nouns ending in *y*, as in *clayey*, *skyey*, etc.

See *ocular,* etc., *ophthalmia,* etc., *optic,* etc.] **1.** The organ of vision; the physiological mechanism of the sense of sight; an anatomical arrangement of parts by which optical images may be formed; in general, any part of an animal body by means of which the faculty of vision is exercised, or the impact of the light-rays is sensed as a visual impression or optical image. In most of the higher animals, as nearly all vertebrates, the eye is developed as a very special sense-organ of great structural complexity and functional delicacy. But from the point of view of comparative anatomy an eye is any part of an animal body which responds more readily than other parts to the special stimulus of light, or whose activity is specially excited by the impact of light-rays. Thus, an extremely rude eye in the form of a mere spot, often a pigment-spot sensitive to light, is common in low animals, as in infusorians, and may be situated anywhere on the body, and may be indefinitely multiplied in number. These rudiments of eyes are commonly described as *eye-specks, eye-points,* or *eye-spots.* (See cut under *Balanoglossus.*) In various cœlenterates and echinoderms organs apparently responsive to the action of light occur in various parts of the body and in varying numbers. Somewhat higher in the scale of evolution, eyes become unmistakable in structural character, however dim or uncertain their actual visual function may be, as in worms, snails, etc. But in some of the *Mollusca,* as cuttlefishes, eyes are highly specialized as visual organs of conspicuous character, comparable to those of vertebrates, though constructed on a different plan. In the vast assemblage of arthropods, as crustaceans, insects proper, and arachnidans, constituting a large majority of the animal kingdom, eyes as a rule are well developed under one or both of two main modifications, namely, the *simple eye* or *ocellus* and the *compound eye* or *oculus.* (See *compound eye,* below, and cut under *falx.*) Such eyes are usually only two, but may be four, six, or eight in number. These higher numbers of eyes occur chiefly in arachnidans, as spiders. Crustaceans have normally a single pair, often mounted on movable eye-stalks or ophthalmites, which are modified limbs of one of the cephalic segments. (See cut under *stalk-eyed.*) A few crustaceans have a single median eye. In vertebrates, where the eyes are normally never more nor fewer than one pair, these organs are received in special formations of the skull, the *sockets* or *orbits* of the eyes; and the eyes are usually further defended from accidental injury by various contrivances, as *eyelids, eyelashes,* and *eyebrows.* (See these words.) Other appendages of the eye namable among its "defenses" are the lacrymal apparatus, which secretes tears to moisten the organ, and the glandular structures (Meibomian follicles), which serve for its lubrication by secreting a greasy substance. The front of the eye has usually a special mucous membrane, the *conjunctiva.* The most essential or intimate parts of the organ of vision are contained in a globe or disk, the *eyeball* (which see), which is freely movable in its socket in the higher vertebrates, and rolled about by the action of various muscles, as the four recti and two obliqui of man and the choanoid muscle of some mammals. Externally the eyeball consists for the most part of a tough opaque membrane, the *sclerotic;* but in front, of a hard transparent structure, the *cornea.* These together are the outermost of three *tunics* or *coats* of the eye; the second tunic consists of the *choroid coat* and *ciliary processes* and the *iris,* and the third and innermost of the *retina,* the expanded end of the *optic nerve,* which enters the ball from behind and spreads out upon the choroid to a varying extent. The retina receives optical impressions focused upon it by the crystalline lens, which are transmitted by the optic nerve to the brain, where they are sensed as visual images. The hollow eyeball with its several tunics forms a kind of camera filled with certain solid and fluid refractive media. Directly in the axis of vision in the interior of the ball is suspended a solid biconvex body, the *crystalline lens,* serving to bring rays of light to a focus on the retina. The lens, inclosed in its capsule, also divides the interior of the eye into two compartments. The larger rear compartment is filled with a glassy fluid, the

vitreous humor, inclosed in a delicate hyaloid membrane, which may also send prolongations through its substance. In front of the lens, between this structure and the cornea, the space is filled with a more watery fluid, the *aqueous humor.* This anterior space is partly divided into an anterior and a posterior chamber by the iris, which hangs in front of the lens like a curtain with a hole in the middle, the *pupil.* Besides the optic nerve, or special nerve of sight, the eye is supplied with other motor, sensory, and sympathetic nerves, and has its appropriate blood-vessels. In man both eyes look directly forward, their axes being parallel, though the orbits in which they are contained present a little outward, or away from each other. The optic nerve follows the axis of the orbit, and consequently pierces the eyeball behind, a little on the inner side—that is, toward the nose. The muscles which move the ball are six, the rectus superior, rectus inferior, rectus externus, rectus internus, obliquus superior, and obliquus inferior. These muscles are innervated by three motor nerves, the oculomotor, trochlear or pathetic (distributed to the obliquus superior), and abducent (distributed to the rectus externus). The ball is embedded in a quantity of adipose tissue forming a soft cushion, but is also somewhat isolated by means of a thin membranous sac called the *vaginal tunic* or sheath of the eye. The ball is nearly spherical or globular, but is a little deeper and wider across than from before backward, measuring about an inch in each of the former axes and $\frac{9}{10}$ of an inch in the latter. (For the structure of the several tunics, see *sclerotic, cornea, choroid, ciliary, iris,* and *retina.*) The retina is an expansion of the optic nerve into a large, circular, concavo-convex sheet, which rests upon the choroid with its inner surface in contact with the body of vitreous humor in the back of the eye. In the middle of it and in the axis of the eye is a little rounded elevation, the *yellow spot,* or *macula lutea,* with a depression at its summit, the *fovea centralis.* To the nasal side of the yellow spot is the entrance of the optic nerve and of the central retinal artery; and here the retina lacks the visual function which characterizes all the rest of its surface. The lens is suspended in a transparent capsule in the axis of vision; it is biconvex, and more convex on its posterior than on its anterior surface. It is about $\frac{1}{3}$ of an inch across and $\frac{1}{4}$ of an inch deep, and its structure presents concentric laminations. It tends to flatten with age. (See *crystalline lens,* under *crystalline.*) The vitreous humor fills the hollow of the eyeball behind the lens. It is a glassy or jelly-like substance, consisting chiefly of water, with a little saline and albuminous material, inclosed in a delicate hyaloid membrane continuous in front with the capsule and suspensory ligament of the lens, and behind resting upon the retina. Some prolongations of the hyaloid enter the substance of this humor, and one of these is called the *canal of Stilling.* The quantity of vitreous humor, or bulk of the vitreous body, is about $\frac{4}{5}$ of the entire mass of the eyeball. The aqueous humor is the slightly saline watery fluid which fills the eye in front of the lens, between this and the cornea, on both sides of the iris, consequently occupying the whole of the anterior and posterior chambers of the eye. Its bulk is very small. (See *conjunctiva, lacrymal, Meibomian, nasal, ocular, ophthalmic, optic, palpebral, superciliary, tarsal,* etc.) The eye agrees with other sense-organs in development in the embryo, in being partly formed by the inversion or involution of a portion of epiblast from without, and partly by protrusion or evolution from within of a primitive ocular vesicle, the two coming together in the situation where the lens is to be developed. The result is that a portion of epiblast from the back of the embryo, which had been shut into the hollow of the cerebrospinal tube, pushes out from one of the cerebral vesicles to meet another portion of epiblast from the face of the embryo. Thus, the retina and associate parts are an outgrowth from the undeveloped brain, while the lens and associate epithelial structures are an ingrowth of epidermis. In other mammals with well-formed eyes the structure is substantially the same as in man, though minor and incidental variations are numerous. The eyes of quadrupeds usually present laterally, and not directly forward. They are usually relatively larger and probably much more effective organs of vision than those of man. They frequently develop a special choanoid muscle or retractor of the eyeball. The iris is commonly black, brown, or of some dark tint, seldom bluish or pale. It often contracts in such a way that the pupil is linear, elliptical, or narrowly oval, instead of circular, as in man. This is well seen in the cat. In birds several modifications occur. The eyeball is strengthened and its shape molded by a set of splint-bones or small bony plates disposed in a circle in the sclerotic around the cornea. The ball is hemispherical with an anterior projection, somewhat like a short acorn in a large cup, and the cornea is very convex. The pupil is always circular, though the iris may be so motile as to present only a narrow ring round the pupil, or to reduce the pupil to a mere point. These changes are well seen in the eyes of owls. There is also in the vitreous humor a peculiar plaiting or folding of the choroid, called the *marsupium* or *pecten.* The visual range and power of the eye in some birds, if not in all, are much greater than in man. All birds have three eyelids, the third very fully developed and arranged so as to sweep entirely across the front of the eye by means of special muscles and tendons upon the back of the eyeball. No birds are eyeless. In reptiles the eyes are structurally more like those of birds than of mammals. Some reptiles are eyeless, or have very rudimentary eyes. Most have eyelids, but these are wanting in ophidians, a transparent cuticle being continued directly over the ball, and shed with the rest of the cuticle. In fishes the eyes are generally symmetrically lateral, but not infrequently dorsal and closely approximated to each other, and rarely inferior; in one type, the heterosomes or flat-fishes, they are, however, both on one side, that belonging to the side which rests on the ground being in the very young in the normal position, but soon actually penetrating through the integument, and with the circumocular cranial region twisting to the opposite side and assuming a permanent position above the regular eye of the colored or uppermost side. The accessories of the eyes of mammals are undeveloped in fishes, but the eyes themselves are sometimes covered by a fold of the integument, and sometimes, as in some sharks, by a peculiar nictitant membrane. Among the most characteristic features are the flattening of the cornea and the sphericity of the crystalline lens. In one group (*Anableps*) a remarkable deviation from all other forms occurs, in that the cornea is divided by a horizontal band of the conjunctiva into upper and lower halves, and two pupils are developed, the species consequently being known as four-eyed fishes. In the lowest of the vertebrates (*Branchiostoma*) the eye is represented by a very small spot, coated with dark pigment and receiving the end of a short nerve. See *vision.*

In the crawfish they are two discoidal plates in the middle of the lateral surface of the walls of the anterior dilated portion of the cardiac division of the stomach, and weigh about two grains. Apple of the eye. See *apple*.—**Artificial eye,** an object made in imitation of the natural eye. Those used for anatomical purposes are constructed of wax or papier maché. Chambers of the eye. See *chamber*.—**Compound eyes,** in insects, simple eyes or ocelli set so close together that their several corneas are in contact, and pressed into tetragonal or hexagonal figures with slightly convex surfaces, giving the eye a faceted appearance, whence the name *faceted eyes*. Each cornea then answers to one of the faces of a cut brilliant. Behind such a cornea, instead of a lens, is placed a transparent pyramid whose base corresponds to the cornea, and whose apex is directed inward to be received into a kind of transparent calyx answering to a vitreous body. This last is surrounded by another calyx formed by the expansion of a nerve-filament arising from a ganglion on the end of the optic nerve, a short distance from the brain. Each lens-like pyramid, with its vitreous body and nerve-filament, is surrounded by a choroid coat, usually of a brown color. The size and shape of compound eyes, and especially the number of their facets, are very variable. Different facets of the same eye also vary in size.—**Crab's eye.** See def. 12.—**Dorsal eyes.** See *dorsal*.—**Evil eye.** See *evil*[1].—**Eye-and-ear observation,** in *astron.*, an observation of the time of passage of a star across a wire, made in the following way: The observer, having his eye at the telescope, listens to the beats of a clock, and notes where the star is at the beat immediately preceding the passage, and where it is at the next following beat. He mentally divides the space run over in this second into tenths, and by estimating in what part of it the wire lies, he determines the time of the passage to a tenth of a second.

(See def. 1, and cut under *falx*.) In arachnidans the eyes are always simple, and have the same structure as those of crustaceans. (See cut under *skull*.) The projection, however, is slight in comparison with the beetling superorbital ridges of many animals, as the gorilla. In birds, and in many reptiles and fishes, the eyebrow is a separate formation of a bone, or chain of bones, along the upper edge of the orbit, whose nature is that of the lacrymal bone. These are known as superorbitals, or superorbital bones or ossicles. (See cut under *Lepidosiren*.) One such bone forms the movable superciliary shield of some birds, as eagles, projecting like the eaves of a roof over the eye. It serves the purposes of protecting and wiping the ball of the eye, as well as of moistening it by spreading the lacrymal fluid over its surface. Eyelids occur in mammals, birds, most reptiles, and *Amphibia*, not in *Ophidia* and true fishes. They are generally two in number, upper and lower, formed of ordinary skin and a layer of conjunctiva, stiffened or not with cartilage, and furnished with appropriate muscles, glands, etc.; they are technically called *palpebræ*. Some animals, as birds, have a third eyelid, the nictitating membrane, a fold of conjunctiva capable of being swept obliquely across the front of the eyeball; some mammals possess it imperfectly developed, as the horse. A similar structure defends the eye of some sharks, though seldom called eyelid. Serpents have no proper eyelids, because the cuticle continues unbroken over the eyeball. See cut under *eye*[1].

The regular establishment of this system dates from 1176 (22 Hen. II.), and it gave place to substantially the present system of assize and nisi prius, under 13 Edw. I., c. 30. It seems that in the earlier periods, when these justices were empowered to levy royal revenues, remonstrances of the people led to a concession that they should make the circuit only once in seven years. Later, when the judicial function became more important, they were directed by Magna Charta to visit every county once a year.

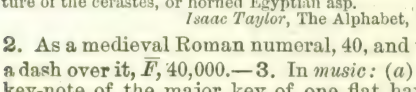
★ **F**, **1.** The sixth letter and fourth consonant in the English alphabet, as in the Latin and the Phenician, and also as in the early Greek alphabet, through which the Latin was derived from the Phenician (see *A*), although it has gone out of use in the alphabet generally known to us as Greek. The Phenician character had the name *vav* or *waw* (meaning 'peg' or 'hook'), and its value was that of our English *w*. This same value it had in primitive Greek use, and it is found so used in western inscriptions, although lost too early to appear in eastern inscriptions. The sound, namely *w*, went gradually out of use in Greek, and its sign went with it. Since the latter somewhat resembled in form one gamma (Γ) written above another, the Greek grammarians gave it the fanciful name of *digamma* or *double gamma*, by which therefore we generally call it as a Greek letter. The comparative scheme of forms (compare *A*) is as follows:



Egyptian. Hieroglyphic. Hieratic. Phenician. Early Greek and Latin.

In the adaptation of the alphabet to Latin use the sign first received the value we give it, since the *f*-sound occurred in Latin and needed a representative; the *w*-sound was provided for by being written with the same character as *u*. (See *U* and *V*.) The sound *f*, as we pronounce it, is a surd (or breathed, or voiceless) labiodental, a fricative sound or spirant: that is to say, it is made by the audible friction or rustling of the unintonated breath, when forced out between the edge of the lower lip and the tips of the upper teeth, these being held in contact with one another. If, everything else remaining the same, the intonated breath be forced out instead, the sound is *v* (as in *valve, vivid*); hence, *f* and *v* are corresponding surd and sonant. An *f*, nearly identical with ours in audible character, may also be made between the edges of the two lips alone, without any help from the teeth; and such a purely labial *f* is heard in many languages, and is with probability to be regarded as more primitive than the labiodental *f*, and as forming the transition to it, in the languages where the latter prevails. The same sound is also widely represented in English by *ph*, but almost only in words coming from the Greek; it also exists in some words written with *gh*, as *laugh, cough, clough, rough, tough*, etc., the labial aspirant having taken in such words the place of the palatal, such change being recognized in the spelling in only a few words, as *dwarf, draft* (= *draught*), *duff* (= *dough*, as formerly pronounced), etc. Historically, *f* stands in general for a more original *p*, as found in Sanskrit and the classical languages: thus, *father* for *pitar*, *πατήρ*, *pater*, etc.

Thus the letter *F* is derived from the Hieroglyphic picture of the cerastes, or horned Egyptian asp.
Isaac Taylor, The Alphabet, I. 12.

2. A real state of things, as distinguished from a statement or belief; that in the real world agreement or disagreement with which makes a proposition true or false; a real inherence of an attribute in a substance, corresponding to the relation between the predicate and the subject of a proposition. By a few writers things in the concrete and the universe in its entirety are spoken of as *facts*; but according to the almost universal acceptation, a *fact* is not the whole concrete reality in any case, but an abstract element of the reality. Thus, Julius Cæsar is not called a *fact*; but that Julius Cæsar invaded Britain is said to have been a *fact*, or to be a *fact*. To this extent, the use of the word *fact* implies the reality of abstractions.

With the majority of writers, also, a *fact*, or *single fact*, relates only to an individual thing or individual set of things. Thus, that Brutus killed Cæsar is said to have been a *fact*; but that all men are mortal is not called a *fact*, but a *collection of facts*. By *fact* is also often meant a true statement, a truth, or truth in general; but this seems to be a mere inexactness of language, and in many passages any attempt to distinguish between the meanings on the supposition that *fact* means a true statement, and on the supposition that it means the real relation signified by a true statement would be empty subtlety. *Fact* is often used as correlative to *theory*, to denote that which is certain or well settled — the phenomena which the theory colligates and harmonizes. *Fact*, as being special, is sometimes opposed to *truth*, as being universal; and in such cases there is an implication that *facts* are minute matters ascertained by research, and often inferior in their importance for the formation of general opinions, or for the general description of phenomena, to other matters which are of familiar experience.

I am wounded
In *fact*, nor can words cure it.
Fletcher (*and another*), Elder Brother, iv. 1.

The Right Honorable gentleman is indebted to his memory for his jests and to his imagination for his *facts*.
Sheridan, Speech in Reply to Mr. Dundas.

In order to believe that gold is yellow, I must, indeed, have the idea of gold, and the idea of yellow, and something having reference to these ideas must take place in my mind; but my belief has not reference to the ideas, it has reference to the things. What I believe is a *fact* relating to the outward thing, gold, and to the impressions made by that outward thing upon the human organs; not a *fact* relating to my conception of gold, which would be a *fact* in my mental history, not a *fact* of external nature.
J. S. Mill, Logic, I. v. § 1.

The basis of all scientific explanation consists in assimilating a *fact* to some other *fact* or *facts*.
A. Bain, Logic, III. xii. § 2.

A law is a grouping of observed *facts*. *Challis.*

A world of *facts* lies outside and beyond the world of words. *Huxley*, Lay Sermons, p. 57.

The whole human *fact* of him, as a creature like myself, with hair and blood and seeing eyes, haunted me in that sunny, solitary place, not like a spectre, but like some friend whom I had basely injured.
R. L. Stevenson, Merry Men.

3. In *law*, an actual or alleged physical or mental event or existence, as distinguished from a legal effect or consequence: as in the phrases *matter of fact*, *question of fact*, *the facts of the case*, as distinguished from *matter of law*, *question of law*, *the law of the case*. Thus, whether certain words were spoken is a question of *fact*; whether, if spoken, they constituted a binding promise, is usually a question of *law*. — **Ablative fact**, a fact which according to law takes away a right. — **Collateral facts.** See *collateral*. — **Collative fact**, a fact appointed by law to give commencement to a right. — **Conclusion of fact.** See *conclusion*. — **Divestitive fact.** Same as *ablative fact*. — **Error in fact.** See *error*. — **Evidential** or **evidentiary facts.** See *evidential*. — **Fact of consciousness**, a fact whose existence is given and guaranteed by an original and necessary belief. — **Fixed fact.** See *fixed*. — **In fact**, in reality; in truth; indeed.

This . . . made the government absolute, and led to consequences which, as by a fixed law, must ever result in popular governments of this form: namely, to organized parties, or rather *factions*, contending violently to obtain or retain the control of the government.

3. In *Rom. antiq.*, one of the classes into which the charioteers in the circensian games were divided, one of each contending in a race. The four regular factions, distinguished by their dresses as the green, red, blue, and white, represented spring, summer, autumn, and winter. Domitian added purple and yellow factions, making six contestants in every race; but these new divisions were not permanent. A dispute in Constantinople, in 532, between the green and blue factions and their partizans, the emperor Justinian favoring the latter, led to a civil war of five days, which cost 30,000 lives and nearly overthrew the government.

Their trains must bate,
Their titles, feasts, and *factions*.
B. Jonson, Sejanus, ii. 2.

The adjunct predicated of the object is called a *factitive* or *objective predicate* (sometimes, less correctly, a *factitive object*).

For instance, in certain branches of this stock, as the Persian, etc., . . . the tendency of causal verbs to lose their force altogether, even with the longer *factitive* form, which they faithfully keep, is only the breaking through of that principle which asserted itself almost universally in the late analytic state of the group.

In the middle ages foreign factories existed in most large European cities, and to a later period in many Asiatic and African ports, often giving rise, especially in India, to the acquisition of extensive political power. When the more simple kinds of work commonly done in shops, however, are carried on in large establishments, the latter are often called factories; but establishments for some branches of production are seldom or never so called, however large, as machine-shops, car-shops, coopers' shops, etc. Also called *manufactory*.

They abound especially around sun-spots and are most conspicuous when near the limb; they are found, however, on all parts of the disk, even near the poles. They owe their relative brilliance mainly to the fact that they protrude above the general surface of the photosphere, and so lose less light by absorption in the solar atmosphere. But the spectroheliograph shows that they carry up with them great quantities of calcium vapor. Indeed the photographs taken with this instrument show the whole solar disk mottled with luminous patches of this substance.

=Syn. 2. *Fairy, Elf, Fay; Sylph, Gnome; Jinn, Genie; Goblin.* *Fairy* is the most general name for a diminutive imaginary being, generally in human form, sometimes very benevolent or inclined to teach moral lessons, as the *fairy* godmother of Cinderella; sometimes malevolent in the extreme, as in many fairy stories. Spenser took up the word in Chaucer's spelling, *faerie* or *faery,* and gave it an extended meaning, which is now commonly confined to that spelling and to his poem; the personages in "The *Faery* Queene" live in an unlocated region, essentially like the rest of the world, and are of heroic and occasionally supernatural powers; these personages he sometimes calls *elves* or *elfins.* In ordinary use an *elf* differs from a *fairy* only in generally seeming young, and being more often mischievous. Pope, in "The Rape of the Lock," has given a definite cast to *sylph* and *gnome;* these two words are elsewhere often associated, *gnomes* having always been fabled as living in underground abodes, and especially as being the guardians of mines and quarries, while *sylphs* are denizens of the air. From this difference of place it has followed that *gnomes* are generally thought of with repugnance or dread, and *sylphs,* although of both sexes in literature, are popularly thought of as young, slender, and graceful females: hence the expression "a *sylph*-like form." To Oriental imagination is due the *jinn, djinn,* or *jinnee;* the form *genie* is most vividly associated with the "Arabian Nights": as, the *genie* of Aladdin's lamp; the *genie* that the fisherman let out of the bottle. A *goblin* is wicked, mischievous, or at least roguish, and frightful or grotesque in appearance. See the definitions of *kobold, sylph, brownie, banshee, sprite, pixie, nixie, nymph,* etc.

It is always supposed to be *close* unless the attitude is mentioned in the blazon. Where the falcon is described as *jessed and belled*, the jesses are represented as hanging loose.

Specifically— 2. A false syllogism; an invalid argumentation; a proposed reasoning which, professing to deduce a necessary conclusion, reaches one which may be false though the premises are true, or which, professing to be probable, infers something that is really not probable, or wants the kind of probability assigned to it. A fallacy is either a *sophism* or a *paralogism*, according as the deceit is intentional or not. But the word *paralogism* is also used to signify a purely logical fallacy — that is, a *formal fallacy*, or a direct violation of the canons of syllogism. Logicians enumerate as many different kinds of formal fallacy as they give of canons of syllogism, from four to eight. See below.

No man was less likely to be imposed upon by *fallacies* in argument, or by exaggerated statements of fact.
Macaulay, Boswell's Johnson.

A *fallacy* is used to mean: (1) A piece of false reasoning, in the narrower sense; either an invalid immediate inference, or an invalid syllogism; a supposed equivalent form which is not equivalent, or a syllogism that breaks one of the rules. (2) A piece of false reasoning, in the wider sense; whereby from true facts a false conclusion is inferred. (3) A false belief, whether due to correct reasoning from untrue premises (reasons or sources) or to incorrect reasoning from true ones. (4) Any mental confusion whatever. *A. Sidgwick*, Fallacies.

Fallacies in things, according to the old logicians, fallacies that are not in words. They are of seven kinds: (1) The *fallacy of accident*, arising when a syllogism is made to conclude that, because a given predicate may be truly affirmed of a given subject, the same predicate may be truly affirmed respecting all the accidents of that subject. (2) The *fallacy of speech respective and speech absolute*, occurring when a proposition is affirmed with a qualification or limitation in the premises, but virtually without the qualification in the conclusion. (3) The *fallacy of irrelevant conclusion*, or *ignoration of the elench*, occurring when the disputant, professing to contradict the thesis, advances another proposition which contradicts it in appearance but not in reality. (4) The *fallacy of the consequent*, or *non sequitur*, an argument from consequent to antecedent, which may really be a good probable argument. (5) *Begging the question*, or the *petitio principii*, a syllogism, valid in itself, but in which that is affirmed as a premise which no man who doubts the conclusion would admit. (6) The *fallacy of false cause*, arising when, in making a reductio ad absurdum, besides the proposition to be refuted, some other false premise is introduced. (7) The *fallacy of many interrogations* in which two or more questions are so proposed that they appear to be but one: as, "Have you lost your horns?" a question which implies that you had horns.— **Fallacies of composition and division,** fallacies which arise when, in the same syllogism, words are employed at one time collectively, and at another distributively, so that what is true in connection is inferred to be also true in separation, or the reverse.— **Fallacy of accent,** a fallacy arising from the mode of pronouncing a word.— **Fallacy of amphibology,** a fallacy arising from the doubtful construction of a sentence.— **Fallacy of an illicit process,** a false syllogism in which a term enters into the conclusion with a different distribution from what it had in the premise.— **Fallacy of equivocation,** a fallacy arising from the double meaning of a word.— **Fallacy of figure of speech,** a fallacy arising from a tropical use of language.— **Fallacy of homonymy,** a fallacy arising from the double meaning of a single word.— **Fallacy of illicit particularity,** a syllogism in which the degree of particularity of the conclusion is different from the sum of those of the premises. See *particularity*.— **Fallacy of no middle,** a false syllogism in which the premises have no term in common that is dropped from the conclusion.— **Fallacy of undistributed middle,** a syllogism in which the middle term is undistributed in both premises: as, He who says that you are an animal speaks truly; he who says that you are a goose says that you are an animal; therefore, he who says that you are a goose speaks truly.— **Fallacy of unreal middle,** a fallacy which fails to assert the existence of any object of the kind denoted by the middle term: as, Pegasus was a horse, and Pegasus had wings; therefore, some horse has had wings.— **Semilogical fallacy,** or **fallacy in words,** a fallacy which deceives by some defect of language, and ceases to do so when the meaning of the propositions is strictly analyzed.

4. In the most general sense, those who descend from a common progenitor; a tribe or race; kindred; lineage. Thus, the Israelites were a branch of the *family* of Abraham; the whole human race constitutes the human *family*.

Hence—**5.** Any group or aggregation of things classed together as kindred or related from possessing in common characteristics which distinguish them from other things of the same order. Thus, a body of languages regarded as representatives of a common ancestor, or as having come by gradual processes of alteration and divarication from the same original tongue, is called a family: as, the Indo-European *family*; the South African *family*.

There be two great *families* of things, sulphureous and mercurial. *Bacon*, Nat. Hist.

The states of Europe were, by the prevailing maxims of its policy, closely united in one *family*. *Everett.*

Specifically—**6.** In scientific classifications, a group of individuals more comprehensive than a genus and less so than an order, based on fewer or less definite points of physical resemblance than the former, and on more or more definite ones than the latter. In zoölogy the name of a family now should invariably end in *-idæ*, which has the force of a patronymic. The prime divisions of a family are termed *subfamilies*, and end usually in *-inæ*. The prime associations of families are in some refinements of classification called *superfamilies*; there is no obvious distinction, however, between these and suborders. The recognition and definition of the family, as of other zoölogical groups, is entirely a matter of expert opinion, having no natural necessity for being; hence the wide difference among zoölogists in their evaluation of the term. A modern family is usually less comprehensive than a genus as used in the 18th century. The use of the regular termination *-idæ* has done much to fix the valuation of the family more stably than that of either the genus or the order. Zoölogical families are considered as being approximately of the same grade in classification as the groups formerly called orders in botany. Botanists generally, following Jussieu (1789), called these groups *natural orders*, not using *family* as a systematic term. This threw botanical classification out of harmony with zoölogical classification and resulted in much confusion and inconvenience. The need of a reform in this direction had been strongly felt, and it was inaugurated in 1887 with the appearance of the first fascicles of "Die natürlichen Pflanzenfamilien" of Engler and Prantl. The termination *-aceæ* is used nearly uniformly by Engler. See *order*, 5 (*b*).

faro (fā'rō), *n.* [Also written *pharao*, *pharaon*, after F. *pharaon*; said to be named from a figure formerly on one of the cards, representing Pharaoh, King of Egypt.] A game played by betting whether certain cards will win or lose. The players sit at one side of a table, and the dealer at the other. The dealer always represents the bank, having in charge the paying and claiming of bets. In the United States the table has on its center the "lay-out," or representation of thirteen cards, from the ace up to the king, in regular order. After bets have been placed on single cards or combinations, the dealer removes the top card from a complete pack placed face up in a box, laying it on his right hand; he then withdraws the next one, laying it immediately beside the box. This second card is the 'loser' on the turn and the card which is now seen face upward in the box is the 'winner' on that turn. In the old days the banker took all bets on losing cards, but the modern system is to allow the players to copper cards that they play to lose. The cards are withdrawn in this manner, two at a time, until the last turn, upon which the players can either bet in the usual way or can call the order in which the last turn will come. If there are three different cards in the box, they may come in six different ways, but the bank pays 4 for 1 only. If two cards of the same denomination are in the last turn it is called a 'cat-hop.' They can come in three different ways, and the bank pays 2 for 1.

2. Voluntary abstinence from food, as a religious penance or discipline, as a means of propitiation, or as an expression of grief under affliction present or prospective. Roman Catholic theologians distinguish between *natural* and *ecclesiastical fasts.* In the former, which are required of those who are about to communicate, there is a total abstinence from all food and drink; the latter imposes certain limits and restrictions as regards both the kind and the quantity of the food.

3. A time of fasting; the prescribed period or duration of abstinence. The only fast ordained by the Mosaic law was that of the day of atonement; but other fasts were subsequently instituted on account of great national calamities, and special fasts also were appointed on account of special impending peril. In the Roman Catholic Church all baptized persons over twenty-one years of age are required to observe appointed days of fasting, on which, subject to certain exceptions and exemptions, as the requirements of health, they are required not to eat more than one full meal. These days include the forty days of Lent, the ember-days, the Fridays of the four weeks of Advent, and the vigils of Pentecost or Whit-Sunday, of the feasts of St. Peter and St. Paul, of the Assumption of the Virgin Mary, of All Saints, and of Christmas day. All Fridays not fast-days are days of abstinence. (See *fast-day,* 1.) In the Greek Church, in addition to the forty days of Lent, there are three principal fasts, each lasting a week: (1) that of the Holy Spirit, immediately after Pentecost; (2) that of the Virgin, in August; and (3) that of the Nativity. In the Episcopal Church, Ash Wednesday and Good Friday are fasts; Lent, the ember-days, the three rogation-days, and all Fridays are only days of abstinence.

A day on which fasting is observed; specifically, a day appointed for fasting as a religious observance by some recognized authority, ecclesiastical or civil; in the most restricted ecclesiastical sense, a day on which, or on part of which, total abstinence from food is prescribed, in contradistinction to a day on which a limitation is imposed on the kind or quantity of food to be taken, called a *day of abstinence.* See *fast*[3], *n.* In some of the United States, especially in New England, special days of fasting and prayer are appointed by the governor of the State, a custom derived from the original Puritan settlers.

The Pilgrims found it written, "They that sow in tears shall reap in joy. He that goeth forth and weepeth, bearing precious seed, shall doubtless come again with rejoicing, bringing his sheaves with him." This beautiful poetry was translated into the policy of the Pilgrims by establishing a *Fast-day* in March or April, and a Day of Thanksgiving in November. Thus the whole people were to pass through the two gates of the year, Tears and Smiles, and observe them as Holy Days, all other profane and misleading festivities—Christmas, New Year's, and Saint's days without number—being laid aside.
H. W. Beecher, Norwood, xlix.

2. In Scotland, a day set apart for humiliation and prayer; specifically, a day thus observed during the week immediately preceding certain celebrations of the Lord's supper. Business is generally suspended during these fast-days. Formerly their observance on fixed half-yearly or yearly dates, differing for different localities, was universal; but the growing tendency to make them mere holidays has led to their abolition in Edinburgh, Glasgow, and elsewhere.

II. *n.* [= D. *vet*, G. *fett*, Sw. *fett* = Dan. *fedt*, fat, n.; from the adj.] **1.** A white or yellowish oily solid substance forming the chief part of the adipose tissue of animals, and also found in plants. In chemistry the fats are odorless, tasteless, colorless or white bodies, which may be either solid or liquid. They are insoluble in water and cold alcohol, but dissolve freely in ether, chloroform, and benzine. The solid neutral fats, like spermaceti, suet, and lard, and the liquid non-volatile oils, like sperm- and olive-oil, are classed together as fats. They are compound ethers formed by the union of fatty acids with (generally) the alcohol glycerin. They are composed of carbon, hydrogen, and oxygen, but contain no nitrogen. The most common and abundant are stearin, palmitin, and olein. Of these stearin and palmitin are solids at ordinary temperatures, and olein is a liquid. Most animal and vegetable fats are mixtures of two or more of the simple fats, and their hardness depends largely on the relative quantity of olein or other liquid fat in them. When a fat is treated with an alkali, the fatty acid unites with the alkaline base, making a soap, and glycerin is set free. When a soap is treated with an acid, the base is taken from the fatty acid which is thus set free.

It. *fatalismo*; as *fatal* + *-ism*.] **1.** The doctrine that all things are subject to fate, or come or go by inevitable predetermination. *Fatalism* is a doctrine which does not recognize the determination of all events by causes, in the ordinary sense; holding, on the contrary, that a certain foreordained result will come about, no matter what may be done to prevent it. *Fatalism* is thus directly opposed to *necessitarianism*, according to which every event is determined by the events which immediately precede it, in a mechanical way. *Necessitarianism* seems hardly to leave room for final causes, while *fatalism* is the doctrine that certain results are sure to come in spite of all that efficient causes may do to prevent them. See *necessity*.

To confute these three *fatalisms*, or false hypotheses of the system of the universe, Cudworth designed to dedicate three great works—one against atheism, another against immoral theism, and the third against the theism whose doctrine was the inevitable "necessity" which determined all actions and events, and deprived man of his free agency. *I. D'Israeli*, Amen. of Lit., II. 398.

Had raised my birth, or had debas'd my mind.

Midst joy or sorrow *fate* shall work its will.

And Rome of her great charge grew weary here at last.
Drayton, Polyolbion, viii. 341.
